EXECUTIVE SUMMARY

Purpose of the RainReady Plan

From more intense storms and chronic urban flooding to economic constraints and aging infrastructure, communities across the nation must find ways to thrive in the midst of shocks and stresses.

In April 2013, Cook County experienced a massive shock in the form of a severe rain and wind storm that resulted in severe damages to housing and infrastructure. One of the hardest hit parts of the county is an area referred to as the Calumet Corridor, which includes the communities Blue Island, Calumet City, Calumet Park, Dolton, Riverdale, and Robbins. The purpose of the RainReady Calumet Corridor Plan is to articulate a shared vision to put these six communities on a path towards greater resilience through improved stormwater management, sustainable economic development, and integrated planning.

The RainReady Calumet Corridor Plan represents the collective vision of over 2,100 residents, business owners, and municipal staff, elected representatives, regional leaders, and non-governmental organizations that all have a shared interest in strengthening the homes, neighborhoods, communities throughout the Calumet Corridor. Each of the six Calumet Corridor communities has a unique path ahead and this plan will support that journey by:

- Establishing a shared understanding of the scope, severity, and type of flooding risks across each community in the Calumet Corridor
- Identifying and prioritizing—through a collaborative planning process—RainReady solutions that provide multiple benefits to the community
- Providing municipal and community leaders with a clear roadmap for plan implementation
- Advancing existing planning and development priorities that align with the general principles of a RainReady community

“Urban Resilience is the capacity of individuals, communities, institutions, businesses, and systems within a city to survive, adapt, and grow no matter what kinds of chronic stresses and acute shocks they experience.”
- www.100resilientcities.org

Building on the success of the RainReady Community Planning model in the Village of Midlothian, the Center for Neighborhood Technology (CNT) partnered with the U.S. Army Corps of Engineers (USACE) to lead this planning process beginning in February of 2016.
Urban Flooding happens when water inundates property in a built environment, particularly in more densely populated areas, caused by rain overwhelming the capacity of local drainage systems, such as storm sewers (CNT, 2015). Urban flooding occurs when homes, yards, or streets are inundated with water from heavy rains or melting snow, damaging property, and making travel difficult and dangerous. It also results from sewer water backing up through pipes into basements, and from water seeping through foundation walls.

The Problem

The Calumet Corridor is facing a set of complex and interrelated challenges. The area is vulnerable to big storms, as in April 2013, as well as the pervasive, chronic impacts of urban flooding.

Urban flooding is the inundation of property in a built environment, particularly in more densely populated areas, caused by rain overwhelming the capacity of local drainage systems, such as storm sewers (CNT, 2015). Urban flooding occurs when homes, yards, or streets are inundated with water from heavy rains or melting snow, damaging property, and making travel difficult and dangerous. It also results from sewer water backing up through pipes into basements, and from water seeping through foundation walls.

Flooding in the Calumet Corridor can generally be attributed to four primary factors:

- The region’s flat, low-lying, and naturally wet topography
- Historical patterns of land development that covered natural lands with impervious surfaces
- A changing climate, characterized by high-intensity storms
- Aging and undersized infrastructure throughout the region

In addition to the physical factors that contribute to urban flooding, there are also social, economic, and operational roadblocks that complicate the process of planning and implementing effective solutions. These roadblocks include, among others: the high costs associated with understanding how water flows in an urban environment and designing effective flooding solutions; barriers to collaboration within and between communities; fiscal and capacity constraints; and local policies that may not be aligned with the goals of building more resilient communities.

This plan takes into account both the physical drivers of urban flooding, as well as the complex factors that either enable or impede a path towards greater community resilience.
The Path Ahead

A RainReady future for the Calumet Corridor is well within reach. Although this plan was prompted by the problem of urban flooding, the path ahead will build upon—and strengthen in turn—each community’s unique strengths, or assets. In fact, each of the six communities in the Calumet Corridor possesses the foundational community assets, strengths, and know-how necessary to mitigate flooding and achieve broader community goals.

By bringing flooding challenges and solution opportunities into the light, creating venues for collaboration, and outlining a clear roadmap for implementation, this plan—and the planning process through which it was developed—aims to support each community’s path towards a resilient revitalization.

We have organized our recommendations in this plan into a framework for action across scales and institutions. “The Three R’s” of resilience are:

- **Reorient communities.** Put communities on a path towards greater resilience by reorienting day-to-day operations and long-term planning.
- **Repair existing infrastructure.** Establish modernized infrastructure systems that allow communities to survive and thrive no matter what shocks and stresses they face.
- **Retrofit the landscape.** Create beautiful communities by converting underutilized impervious surfaces into natural landscapes, installing concentrated and integrated green-grey infrastructure, and restoring natural areas.

For each of the “Three R’s,” specific strategies and actions can be led by:

- Local residents and business owners
- Municipal staff
- Elected representatives
- Regional stakeholders

Similarly, these actions are designed to be implemented across scales:

- A Home or business
- A Neighborhood
- A Community
- A Region

As well as across geographies:

- Homes and neighborhoods
- Shopping areas and business districts
- Industrial centers and transportation corridors
- Open space and natural lands
- Community-wide

The vision for resilience articulated in this plan document was developed through a one-year collaborative planning process, which included extensive on-the-ground community engagement.
How to Use this Plan

This plan is organized into three chapters: 1) Introduction and Regional Context; 2) The RainReady Solutions, and 3) the RainReady Plans for each community.

Part 1: Defines the problem to be addressed, provides a broad vision for the future of the Calumet Corridor, and describes a path forward.

Part 2: Describes RainReady Solutions, which is organized according to the “Three R” Framework. This section provides a suite of general strategies and actions.

Part 3: Includes each of the six RainReady Plans for the six communities of the Calumet Corridor. Each of these RainReady plans includes a Citizen’s Guide, a brief snapshot of community context, a summary of findings from our flooding risk and resilience opportunity assessment, and—perhaps most importantly—an action plan outlining the specific actions to be taken.

The plan is intended to be read and used by several distinct audiences. Here are some places to focus your attention and ways use this plan:

- If you are a local resident or business owner:
  - Read the Citizen’s Guide for a quick summary and to learn some easy steps to make your home or business more resilient to storms
  - Read through the Action Plan for your community and see which actions you can take on your own property or within your neighborhood or business corridor
  - Consider joining your community’s Steering Committee to take a more active role in helping to make your community more RainReady

- If you are a municipal staff person or elected representative:
  - Familiarize yourself with your community’s RainReady Plan
  - Adopt the plan* and refer to it when making decisions for capital improvement projects (CIPs) and ongoing operations and maintenance (O&M) activities
  - Refer to your community’s Action Plan when you are exploring grants and reviewing your capital budget

- If you are a regional stakeholder:
  - Read the Regional Context to see how this plan builds upon and supports other ongoing regional planning and implementation efforts
  - Review the Action Plans for the communities in which your organization or agency is active; identify opportunities to collaborate with local partners to refine and implement specific recommendations
  - Continue to partner with other organizations; coordinate your efforts through regional collaboratives like the Calumet Stewardship Initiative (CSI), Millennium Reserve, Calumet Heritage Partnership (CHP), and through the various councils, committees, and work groups active in the area; identify recommendations in this plan that could be incorporated into the work plan of these regional collaboratives

*This plan outlines a path forward towards a more resilient Calumet Corridor, but implementation of specific recommendations will have to occur at the local level. Adopting this plan demonstrates your municipality’s commitment to considering these recommendations during capital planning and decision-making efforts and implementing the recommendations as necessary resources become available. The action plans outlines the actions and associated implementation steps, relative priority, estimated timeline, and potential project leads and resources needed. Further analysis is needed to estimate the costs of most recommendations.
INTRODUCTION

The Vision

**WHAT WOULD A RAINREADY CALUMET CORRIDOR LOOK LIKE?**

It would be a region where residents and businesses receive relief from flooding in a way that also creates more beautiful neighborhoods, new jobs, more education and recreation opportunities for people of all ages and walks of life, more commercial activity, and healthier natural areas. In a RainReady Calumet Corridor, schoolyards capture rainwater and create more active spaces for children to learn and play; homeowners have access to expert guidance on home flooding solutions that work; and new businesses frequently pop up along revitalized commercial streets where native flowers bloom in spring. New green infrastructure installations are maintained by local graduates of green job training programs.

This vision is possible. The Calumet Corridor – and the broader Calumet region – benefits from a tremendous legacy of industrial leadership, abundant natural resources, and an inspired network of individuals and groups committed to working together to build more livable communities.

This plan represents the collective vision of over 2,100 residents, business owners, municipal employees, elected representatives, regional leaders, and non-governmental organizations. It outlines a coordinated plan to build community resilience, which is the capacity of individuals and communities to survive, adapt, and thrive no matter what shocks and stresses they may encounter.

Building community resilience requires coordinated action across different scales. The solutions outlined in the RainReady Calumet Corridor Plan are organized by the scale of: homes and neighborhoods; business districts and shopping centers; industrial centers and transportation corridors; and open space and natural areas.
Ms. Broughton is not alone in her fight against flooding. Her experience is shared by millions of Illinois residents who, although they may live outside of a federally-designated “floodplain,” nonetheless could potentially experience flooding in their homes and communities. In fact, the average amount that Calumet Corridor residents spent on flood-related damages (amongst survey respondents who flooded at least once since 2006, n=396) is $4,623. Flooding is a major problem in the Calumet Corridor and can affect homes, businesses, neighborhoods, and infrastructure systems in several ways:

- **Overland Flow** in which stormwater ponds or pools, in streets and yards and then enters buildings through windows, doors or other openings
- **Overbank/Riverine** in which rising floodwaters “overbank” from rivers and streams
- **Sewer Backups** in which combined stormwater and sewage backs up through floor drains, bathtubs, toilets, and sinks
- **Seepage** in which water enters structures through cracks in foundation walls and basement floors

The 2013 floods left Loretta Broughton with little hope for ever keeping her basement dry. That April night, she sat in her kitchen for hours watching smelly water creep from her first floor bathroom. The power was out, the sump pump had failed, and the rain showed no signs of slowing.

Ms. Broughton has spent thousands of dollars rodding pipes, sealing her foundation, and installing a drain tile around her building, but the flooding continues. Meanwhile, her insurance premiums rise. Around that time, Ms. Broughton gave up use of her basement, and began making plans to move, “I know that there’s nothing I can do about it. I don’t have the finances to do what needs to be done.”

“Every time it rains now, honestly, when they say rain, I’m like, Oh God please, Jesus please, don’t let the lights go out, because if the lights go out the power goes out and the sump pump will not work.”

Ms. Broughton loves her house, but the floods make it feel much less like home.
In an effort to better understand where flooding occurs throughout the Calumet Corridor, the type of flooding, and the impact of flooding, the RainReady Community Team sent a survey to all 41,529 homes in the six community planning area. Through the RainReady Planning process we collected 550 resident surveys from across the Calumet Corridor. Here are some key findings from the RainReady Community Survey:

- **Basement backup** from the local sewer system and damaged private lateral lines, impacting several parts of town
- 75% of survey respondents said they experience some type of flooding when it rains
- 95% of survey respondents who experienced flooding live outside of a mapped floodplain
- 64% of survey respondents experienced water seeping in through cracks in foundation walls, 50% experienced sewer backups, and 31% experienced both
- 54% of survey respondents flooded five or more times since April 2006
- On average, respondents who have experienced flooding have spent $4,623 for flood repairs
- On average, survey respondents are willing to invest $2,164 to reduce future flooding risk
- 49% think their local governments are not at all prepared to address flooding issues

**Did You Know?**

Many people think that flooding only occurs in places near rivers, lakes, or ocean coastlines. However, it can flood anywhere it rains. In fact, recent research has shown that 92% of flooding in Illinois occurs outside of the mapped floodplain. Flooding that happens outside of a floodplain in an urban area is called urban flooding. CNT defines urban flooding as “the inundation of property in a built environment, particularly in more densely populated areas, caused by rain overwhelming the capacity of drainage systems, such as storm sewers” (CNT, 2015). Urban flooding occurs when homes, yards, or streets are inundated with water from heavy rains or snow melt, damaging property, and making travel difficult and dangerous. It also results from sewer water backing up through pipes into basements, and from water seeping through foundation walls. CNT is involved in policy and advocacy efforts that seek to bring more awareness to the issue of urban flooding nation-wide.
Statistics like those on the previous page are important because they help planners understand the problem and potential solutions. Resident stories are another powerful way to create shared understanding of the problem, reveal that people are not alone, and to mobilize people to work towards a coordinated solution. Here are just a few excerpts taken from numerous conversations with residents:

- “It’s been horrible,” she said. “I’ll be honest. When I bought the home, I was told I wasn’t in a flood zone, so I didn’t get the flood insurance. So I had to take a loss.” — Calumet City Resident
- “When it rains real bad [sewage] comes up,” she said. A local contractor told her it would cost $10,000 to install a sump pump, “I wish I had known about all that before I bought here.” — Calumet City Resident
- “I have to put wood pallets down to help the kids get off the bus when it’s raining” — Dolton Resident
- “Every year the water gets closer and closer to flooding our church. We can’t use our yard sometimes because the area is flooded, or the ground is too soft, or the mosquitos.” — Dolton Resident
- “We have three sump-pumps that are constantly running, even when it’s not raining. I want to use our church basement for our youth group and other gatherings, but we’re worried it’s going to flood” — Robbins Resident
- “We just finished our basement–pool table and all. And last week we had over two feet of [sewage] back up. It was a mess!” — Dolton Resident
- “The water gets so high it floods the street, my yard, and comes in through my basement window” — Blue Island Resident
- “I did a backflow check valve system, installed by a plumber. That supposedly would stop anything from coming back up into my house from the sewers,” she says. “I did that last year or two years ago, but I still have had flooding.” — Blue Island Resident
- The pump cost one Robbins’ resident more than $1,000 to purchase and install. “I paid industrial money,” she says. She still avoids her basement at all costs, “because of the mold.” — Robbins Resident
- “I used to have just a little water seeping in, but not like it does now. My basement was finished and I had carpet, but I had to tear it up.” — Riverdale Resident
- “If it wasn’t for the standing water, I probably could put a chair and table in my backyard and sit. But right now I have to sit in my driveway where the pavement is.” — Robbins Resident
- “I love my home. I want to get this fixed.” — Riverdale Resident
- “We tried so many things over the years. We put in an ejector pipe system; it still doesn’t help 100% but it does make it better. I don’t expect anything will ever be 100%.” — Blue Island Resident
- “Sometimes the water gets two feet high in the streets and we have to move our cars or else they will get flooded” — Dolton Resident
Taken together, the various flooding data, stories, and maps that were collected, created, and analyzed through this process paint a clear picture: communities in the Calumet Corridor frequently experience flooding—even during small storms. Flooding—whether it’s a little bit of water that seeps into your basement after a small rain or three feet of sewage that backs up during a large storm—becomes especially problematic when it occurs in vulnerable communities that are still recovering from past storms and that have limited economic resources with which to prepare for and bounce back from future storms. Unfortunately, this is also the case for the Calumet Corridor region, as demonstrated by the following statistics gathered from Cook County’s application to the U.S. Department of Housing and Urban Development’s National Disaster Resilience Competition (NDRC) and other sources:

- **The April 2013 storm event** that occurred between April 16th and May 5th, 2013, resulted in a major disaster declaration (DR-4116)
- In Cook County, this Presidentially-declared disaster cost a total of $962,083,374 in damages
  - $627,885,060 = costs for private residents (this number is estimated by applying a Housing Impact Multiplier of 10 to FEMA Verified Losses in order to capture unidentified damages and account for those who did not apply or were denied assistance)
- **$203,657,950** = costs for private insurance companies
- **$130,540,364** = costs for public agencies/programs (i.e., FEMA, NFIP, CDBG-DR, and SBA)
- **12,720 insurance claims** were made in the zip codes areas covering the Calumet Corridor and $33,153,384 were paid out from public and private insurance providers (NOTE: these figures were gathered for the zip code areas that extend to some areas outside of the Calumet Corridor planning area) (CNT, 2012)
- The Calumet Corridor is considered by Cook County to be the most impacted and distressed area from DR-4116
- As of October 2015, there were still unmet recovery needs in housing and infrastructure
- Nearly 23% of the population of the Calumet Corridor are living below the poverty line. Most of the residents in the Calumet Corridor live within areas of high social vulnerability

In sum, the Calumet Corridor faces: 1) chronic urban flooding issues, 2) a beleaguered recovery from the April 2013 presidentially-declared disaster, and 3) the threat of future rain storms—both small and large. This RainReady Calumet Corridor Plan thus aims to deliver an action plan for addressing this three-pronged flooding problem that is sensitive to other structural roadblocks and capacity potholes (See Page RainReady-16).
CAUSES AND IMPACTS OF URBAN FLOODING

Just as there are several distinct types of flooding affecting the Calumet Corridor, there are multiple factors contributing to rising floodwaters in the area. The precise cause(s) of flooding in any particular neighborhood or site will depend on site-specific conditions; however, flooding in the Calumet Corridor can generally be attributed to four primary factors:

- Flat, low-lying, and naturally-wet topography
- Increasing impervious surfaces
- Changing climate
- Aging and undersized infrastructure

NOTE: more community-specific discussions of flooding risk are provided in each of the community-specific plans.

FLAT, LOW-LYING TOPOGRAPHY

The Calumet Corridor is located in a generally flat, low-lying, and naturally wet part of Northeastern Illinois (of course, the glacial ridge that gave Blue Island its name is one notable exception).

We have the glaciers to thank for the topography of the Calumet Corridor. These impressive, earth-moving forces—the last of which melted away about 16,000 years ago—left behind an extraordinarily flat landscape (see Figure RR-2). Due to the flat landscape, rivers and streams in the Calumet Corridor flow with gentle currents. This makes for easy canoeing and kayaking, but presents challenges for flood control and stormwater management. Since municipal sewer systems rely heavily on gravity to move stormwater within suburban areas, this flatness often causes water to back up in streets and sewers.
Another challenge inherent to the Calumet Corridor relates to the region’s soils. Those same glaciers that flattened the landscape also left behind clay-rich soils, which are known for their poor drainage attributes. Sandy soils, in contrast, tend to drain faster, allowing water to pass through and flow deeper underground. When rain falls on clay-rich soils, however, it has trouble infiltrating—the process by which water enters the ground—and instead pools on the surface or runs off to flood other areas.

There are some notable exceptions within the Calumet Corridor, like Calumet City, which actually has sandy and well-drained soils. In general, however, the region’s flat topography and predominantly clay-rich and poorly draining soils increase the Calumet Corridor’s risk of urban flooding.

**INCREASING IMPERVIOUS SURFACES**

Historical and ongoing land development in the Calumet Corridor contributes to flooding and impacts downstream water quality. These days, rainwater that falls within the Calumet Corridor is likely to hit an impervious surface, such as a street, rooftop, or parking lot, rather than a permeable surface, like a forest, wetland, or prairie. The result is an increase in stormwater runoff, which is rain water that “runs” off of surfaces and must be managed by local sewers and drainage systems.

Prior to European settlement in the early 19th century, the Calumet region comprised of prairies, wetlands, forests, and open water (See Figure RR-1). These generally wet landscapes created diverse habitats that supported rare communities of plants and animals. This biodiversity (meaning the variation of different ecosystems, habitats, and species) made for abundant trading, hunting, and fishing opportunities for Indigenous people, as well as early explorers and settlers (i.e., before the 1830s). Today, however, this biodiversity and local ecosystems are highly threatened.
**A Brief History of the Calumet Region**

1500-1650s  
Algonquian tribes inhabit the region

1570  
Formation of the Iroquois League as Iroquois are pushed westward by European colonization

1650s  
Algonquian tribes are forced westward as the Iroquois raids become more common place

1673  
Europeans arrive in the Calumet region

1754-1763  
The French and Indian War - French defeated, Great Britain gains control over the lands

1805  
Little and Grand Calumet River become one river due to an overflow of the Grand Calumet banks

1818  
Illinois becomes a state with a northern boundary set to include the mouths of the Calumet River and Chicago River

1830  
Extinction of the bison in the Midwest

1848  
The Illinois-Michigan Canal is completed

1848  
The 1st railroad shipment of cargo arrives in Chicago

1869  
The construction of the Calumet Harbor is approved by Congress

1871  
The Great Chicago Fire

1880s  
A heavy steel industry starts to dominate the region

1901-1908  
Construction of the South Shore Line begins, making the dunes and lakeshore area more accessible

1913  
Lincoln Highway - The first transcontinental highway passes through the Calumet area along the Old Sauk Trail

1920s  
Ford Motor Company begins construction of its second biggest assembly plant in the U.S. along the Calumet River

1922  
Calumet Sag-Channel is built as a response to pollution levels in Lake Michigan

1940s  
Landfills begin to appear in the area

1940s-1950s  
The Great Migration accelerates

1972  
The Tunnel and Reservoir Plan (TARP) is adopted to mitigate combined sewer overflows; completion anticipated in 2029

1980s-1990s  
Major steel plants begin to shut down

1985  
People for Community Recovery block proposed expansion of Waste Management’s CID landfill

1992  
The fight against the Calumet Lake Airport is won

1998  
The National Park Service releases the Calumet Ecological Park Feasibility Study and recommends the creation of a National Heritage Area

2006  
Phase I of TARP tunnel systems completed; the tunnel systems were put into service little by little as completed, starting in 1985

2012  
Millenium Reserve Plan enacted

---

**Did You Know?**

The Calumet Corridor is home to eight natural areas of statewide significance. The Forest Preserve District of Cook County (FPDCC) has preserved over 800 acres of critical habitats that harbor unique communities of plants and animals. Alongside a few sites just across the Indiana border, these particular natural communities cannot be found anywhere else in the world! These sites are also home to a number of rare animal species, including prairie insects, reptiles, herons, and otters. A walk through these sites will also unveil marshlands, sand savannahs, sand prairies, sedge meadows, wet prairies, springs and seeps, mesic prairies, swamps, shrub prairies, and mesic woodlands—and the rich array of plant and animal life that these habitats support.

These natural areas not only preserve biodiversity—which is critical for maintaining the long-term health of our land and freshwater resources—but also act like sponges and soak up the rain that falls on them, thus reducing flooding risk in surrounding areas. They also can provide outdoor recreation, environmental education, and volunteer stewardship opportunities for nearby residents and visitors to the area. In light of the numerous benefits they provide, which are also called ecosystem services, the natural treasures found in the Calumet Corridor and broader Calumet region should be stewarded, protected, connected, and made more accessible to communities. Doing so would not only help alleviate flooding, but also make people healthier and communities more livable.
During the 19th and 20th centuries, community and industrial development resulted in a dramatic alteration of the pre-settlement landscape (See Figure RR-4). Open areas were rapidly replaced by impervious surfaces to support human settlement, trade, and industry. Although impervious surfaces, like rooftops and roads, are byproducts of our human need for shelter, transportation, and commerce, they prevent the natural processes of infiltration (i.e., water soaking into the ground) and evapotranspiration (i.e., water evaporating back into the atmosphere through plants and trees). Consequently, rain—instead of being used as a valuable resource—becomes stormwater runoff, a waste product that contributes to local flooding and environmental issues.

Even small storms can generate a large amount of stormwater runoff. For example, a storm that drops one inch of rainfall on a one-acre impervious surface (e.g., a parking lot) would generate 27,154 gallons of stormwater runoff (Note: storms of this size or bigger occurred 13 times in Northeast Illinois in 2016). This is enough runoff to fill over eight backyard swimming pools (at 12 feet round and 48” deep). Put another way, one inch of rainfall on a 1,000 square foot roof will yield approximately 600 gallons of runoff. Although it may be hard to see, rain events (even small ones) produce a lot of stormwater runoff!

Just as problematic as the volume of stormwater runoff, however, are the pollutants this runoff collects as it flows across an urban landscape. Urban surfaces are littered with sediments, debris, oils, road salts, and toxic chemicals. When stormwater runoff transports these pollutants into rivers, streams, and other waterways—which happens often in urban areas—they can degrade aquatic habitats, contaminate water supplies, and prevent safe swimming or water sports.

Today, 33.79% of the total land area of the Calumet Corridor is comprised of impervious surfaces, and this percentage is increasing. As more open land is developed and converted into impervious surfaces, the amount of permeable land decreases. The resulting increases in stormwater runoff cause a variety of problems, such as combined sewer overflows (CSOs), polluted waterways, “flashy”—or flood-prone streams, and urban flooding. The negative environmental impacts of land development are now detected when a watershed (i.e., the area of land that drains into a waterbody) has a total impervious cover as low as 5-10% (Scheuler et al. 2008). This means the streams that flow through Calumet Corridor (e.g., the Little Calumet River, Midlothian Creek, Cal-Sag Channel) are degraded or impaired due, in part, to the impacts of urban stormwater runoff. Put simply, when rainfall cannot find its way into the soil, local water bodies, or back into the atmosphere through the natural water cycle, it could pollute waterways, backup into basements, pool in streets, seep through walls, and overflow over the top of riverbanks. Local stormwater ordinances—like the Metropolitan Water Reclamation District’s (MWRD) Watershed Management Ordinance (WMO)—require that new developments incorporate systems that control the volume and rate at which stormwater runs off from a site. Incorporating green infrastructure best management practices (BMPs) into new developments and redevelopments can greatly reduce the impacts of impervious surfaces.

Did You Know?

In 1970, 85% of polluted U.S. waterways were the result of a single source of pollution, or point source pollution (e.g., an effluent pipe from a factory). The remaining 15% of polluted waterways were caused by runoff from agricultural land and urban areas, or nonpoint source pollution. Today, due to significant advances in environmental regulation and water treatment technologies, these values have flipped. 85% of polluted waterways are now the result of nonpoint source pollution and urban stormwater discharges. The Environmental Protection Agency’s (EPA) first administrator, William Ruckelshaus, pointed to this fact in a 2010 Wall Street Journal opinion article where he called stormwater runoff “the water quality issue of the day” (WEF, 2015: 9).
CHANGING CLIMATE

Many residents in the Calumet Corridor have observed an increase in precipitation in recent years. In fact, interviews with residents and public works staff have anecdotally supported various climate change models that have projected more frequent high-intensity, short-duration storms. According to the 2014 National Climate Assessment (i.e., a report compiled by a team of over 300 experts) heavy downpours have been increasing nationally, especially over the last three to five decades (Melilo et al., 2014). In the Midwest and Northeast in particular, the heaviest rainfall events have become heavier and more frequent. The maps below depict climate projections for the Midwest. They show an anticipated increase in the number of days with heavy rain, and the amount of rain during big storms.

These big storms—paired with the increase in impervious surfaces in the Calumet Corridor—place a heavy burden on local sewer systems, which must manage huge and sudden volumes of water at once. As residents and municipal staff of the Calumet Corridor know all too well, current systems are often not up to the challenge.

Did You Know?

Global climate change is expected to increase the total amount of water falling each year, as well as the frequency of short, intense storms like the April 2013 storm. These maps show projected changes in climate for the 21st century (2041-2070) relative to the late 20th century (1971-2000) across the Midwest.

From left to right: the change in average total precipitation over the year. Across the Midwest, the total amount of water from rainfall and snowfall is projected to increase; increase in the number of days each year with very heavy rain or snow fall (top 2% of all rainfalls each year); increases in the amount of rain falling in the wettest 5-day period over a year. Both (far right and middle) indicate that big storms will increase in intensity and frequency across the Midwest. (Figure source: NOAA NCDC/CICS-NC).
AGING AND LIMITED INFRASTRUCTURE

The sewer systems that serve the Calumet Corridor communities vary significantly in terms of their age, size, type (e.g., combined sewers, separate storm and sanitary sewers) and condition (See Figure RR-7). This variation, the lack of up-to-date and accurate information on local sewers and drainage systems (e.g., accurate GPS locations of system components, details on condition of local sewers), and the cost of collecting this information is a challenge in itself. However, in light of the age of the Calumet Corridor communities, their historical development patterns, and their known flooding problems, it is safe to say that the storm sewers and drainage systems in the Calumet Corridor are generally aging and limited. Moreover, the majority of the sewer systems in the Calumet Corridor are “combined sewer systems,” which is a legacy design that has fallen out of favor in the civil engineering community. Each of these infrastructure-related factors contributes to stormwater management challenges in the Calumet Corridor, discussed briefly below.

First, as sewer systems age, pipes may collapse, crack, or clog, causing issues with local drainage. If not properly repaired or continually maintained, these degraded sewers—including both private lateral lines that connect individual buildings to the mainline sewer, as well as the public sewer itself—can cause stormwater and raw sewage to backup into homes, yards, and the public right-of-way (ROW).

Second, Calumet Corridor sewers were designed for a different time. When they were originally constructed, many local sewer systems were not designed to handle the increased stormwater flow from new development and impervious surfaces. Also, these older sewer systems were sized based on historical rainfall data that did not take into account the impacts of climate change, such as more frequent high-intensity storms. As a result, many of the local sewers throughout the Calumet Corridor are simply too small to handle the volume of water they now receive.
Third, communities in the Calumet Corridor struggle with the legacy design of combined sewers. Combined sewer systems were a popular stormwater management approach in the mid-to-late 19th century. Combined sewer systems are called such because they “combine” stormwater and sewage from buildings in the same sewer, which transports the water from where it enters the system to where it is treated (e.g., Calumet Water Reclamation Plant) and ultimately discharged (as “effluent”) back into a local waterbody (e.g., Little Calumet River). In contrast, many municipalities are gradually transitioning to “separate system” systems, which maintain separate systems to transport stormwater and sewage.

During dry days and small rain events, the combined sewers generally function properly. However, during large storms events—which are becoming increasingly frequent—the capacity of local sewers are often exceeded. This often results in water pooling in streets, yards, and public spaces, as well as sewer backup into basements.

The increased risk of urban flooding is not the only problem associated with aging combined sewer systems. Combined sewers typically include overflow points or “outfalls” into local rivers and lakes. These combined sewer outfalls allow (untreated) stormwater and sewage to “overflow” directly into local waterbodies when sewers reach their capacity during a large storm in order to prevent flooding in developed areas.

These combined sewer overflows (CSOs), can have a devastating effect on aquatic health and drinking water supply. A recent report published by U.S. Environmental Protection Agency (EPA), reported that 22 billion gallons of untreated wastewater discharged from CSOs flowed...
into the Great Lakes Basin in 2014 (USEPA, 2016). This is extremely problematic, because the Great Lakes Basin holds 84% of North America’s surface freshwater and recent events, like Toledo’s 2014 water crisis, has revealed that human activity (e.g., agriculture and urban development) can render these great resources unusable.

For this reason, combined sewer overflows are considered one of the primary causes for water pollution today. Currently, 772 U.S. cities and water utilities face CSO issues, and many are spending billions of dollars under legally-binding consent decrees to reduce CSO frequency and volume, including the MWRD. For reference, the same EPA report stated that there were 41 CSO events from the MWRD’s Tunnel and Reservoir Plan (TARP) in 2014.

Did You Know?

A popular approach to controlling combined sewer overflows (CSOs), basement backups, and other stormwater management issues is to build underground tunnels and reservoirs that temporarily store wastewater until it can be directed to a wastewater treatment facility. In essence, the tunnels provide a place to hold large volumes of stormwater and sewage while the treatment plants “catch up” with the storm. These tunnels can be miles long, up to 60 feet in diameter, and cost billions of dollars to construct. The Metropolitan Water Reclamation District of Great Chicago (MWRD)—the regional stormwater utility that serves the City of Chicago and 40 other suburban communities—has taken this approach to managing flooding and combined sewer overflows. Upon completion in 2029, the MWRD’s Tunnel and Reservoir Plan (TARP) will consist of 109.4 miles of tunnels and three reservoirs. The Tunnel will collectively provide 20.6 billion gallons of storage capacity for combined sewage and stormwater to the MWRD’s 352-square-mile service area, which includes the Calumet Corridor. Although TARP has already proven to be effective in reducing CSOs and improving water quality, the system’s full potential to mitigate local flood issues is still largely unrealized. This is not due to a flaw in the design of TARP, but rather, limitations of local municipal sewer systems that transport wastewater from homes and neighborhoods to TARP drop shafts and regional interceptor sewers. In other words, there may be bottlenecks in local sewer systems that obstruct or even prevent water from flowing from neighborhoods to TARP drop shafts, which may cause local flooding issues.
THE APRIL 2013 STORM

The devastating rain and wind that hit Northeast Illinois in April 2013 demonstrates what can happen when a large storm descends upon a region that is not prepared to handle it. All of these factors—climate change impacts, limited and aging stormwater and drainage sewer systems, a highly urbanized (i.e., impervious) landscape—conspired to produce a Presidentially-declared Disaster.

The storms that occurred between April 16th and May 5th, 2013 resulted in $962,083,374 of damage in Cook County alone. One of the storms dropped five inches of rain overnight. This storm caused the widespread closure of expressways, flooded viaducts, downed trees, the forced evacuation of residences and nursing homes near rivers due to rising flood-stage levels, and power outages for about 24,000 ComEd customers.

In the Calumet Corridor and nearby communities, ten students had to be rescued by rafts after a school bus got stuck on a flooded street in Dolton, and a sinkhole on Chicago’s South Side swallowed up to three cars and hospitalized one person. Flooding also caused severe delays on Metra and the cancellation of at least 400 flights at Chicago’s O’Hare International Airport.

A reflection of the April 2013 storms reveals a number of mediating factors that contributed to the damage that resulted:

- **It was large.** The April 17th-18th storm that resulted in the deluge of five inches of rain within a 24-hour period is considered to be a 25-year, 24-hour storm event. A storm of this size has a 4% chance of occurring in any given year. Although this storm is not as big as the infamous 100-year storms that many communities are preparing for, which have a 1% chance of occurring in any given year, it is certainly large enough to cause significant flooding and damages.

- **The rain was constant.** The constant rainfall in the days leading up to the 25-year storm on April 17th caused soils to become saturated and local and regional sewer systems to reach their capacity. This led to a situation in which the rainfall between April 17th and 18th had nowhere to go, so it ended up flooding homes, businesses, and public right-of-ways all across Northeastern Illinois.

- **The region’s flat, low-lying, and naturally-wet topography; impervious surfaces; and aging and undersized infrastructure.** See above.

The April 2013 storms caused a great degree of damage within the Calumet Corridor and across the broader Chicago Metropolitan Region. What’s more, storms of this magnitude—and larger—are likely to hit the region
in the future (NCA, 2014). In light of this, it is imperative that communities take strategic steps now to prepare for, mitigate, and avoid the damage that could be caused by future storms. One only needs to look back at that damage caused by the April 2013 storms to understand the costs of inaction and not being sufficiently prepared.

**THE AVERAGE STORM**

The economic, social, and environmental impacts of the April 2013 storms were immense. However, communities in the Calumet Corridor frequently flood from much smaller storms as well. For example, some neighborhoods may experience widespread overland flooding during a 2-year 24-hour storm event. These storms rarely prompt major disaster declarations or even coverage in the local media; however, they have significant impacts in terms of a community's quality of life, business disruptions, and environmental quality.

Interviews with residents, survey responses, and meetings with municipal staff and engineers have revealed that even small storms can result in economic losses and a high degree of stress for Calumet Corridor residents and public works' staff alike. These small storms often go under the radar in public discussions, but can wreak havoc on families and residents. For example, the family with two feet of raw sewage in their newly finished basement, or the newly employed resident who is late to work due to street closures.

Given the more hidden and more diffuse nature of urban flooding (e.g., basement backups, seepage, street flooding), it is sometimes difficult to mobilize the economic resources and political capital necessary to implement solutions to this chronic and widespread problem. However, CNT/RainReady has been committed to bringing the problem of urban flooding to light at all scales of government—from local governments to the federal government—as well as working with local communities to plan and implement effective solutions.

Urban flooding can manifest in a community and region either as an intense shock (e.g., the April 2013 storms) or chronic stresses (e.g., basement backups, street flooding). In light of this, the strategies and actions put forth in this plan aim to enhance community resilience so that individuals, businesses, infrastructure systems, and governments in the Calumet Corridor can survive and thrive no matter what rain-related shock and stress they encounter.
Barriers to Solutions: Structural Roadblocks and Capacity Potholes

In addition to the physical factors that contribute to urban flooding (see above), there are political and economic barriers impeding the path toward a RainReady Calumet Corridor. The following barriers were identified through interviews with municipal staff and regional stakeholders, as well as an extensive literature review.

**Structural Roadblocks:**

Structural roadblocks are broad social, economic, and political factors that create challenges for planning and implementing solutions to urban flooding. We call these structural roadblocks because they are generally found within the foundational structures of a community, for example, the structures through which political decisions are made and executed (e.g., village boards, voting, ordinances), money is allocated (e.g., local tax structure), and residents interact with one another (e.g., social networks, organizations, social infrastructure).

The foundational structures of a community change very slowly over time. Therefore, structural roadblocks cannot be solved through any one “silver bullet” policy, program, or infrastructure project. Rather, overcoming these roadblocks will require a sustained and collaborative effort of multiple actors (e.g., residents, business leaders, elected representatives, regional stakeholders) who are working toward a shared goal or vision for the future.

Key structural roadblocks impeding the road to a RainReady Calumet Corridor include:

- It is often very difficult to understand exactly how water flows in an urban environment with aging infrastructure systems. This may result in political decisions (e.g., strategies for resolving a local flooding issue) being made without a complete understanding of the problem and possible solutions.

- Public agencies and municipalities hesitate to embrace new technologies and approaches.

- Local policies can inadvertently create barriers to the widespread implementation of effective flooding solutions. Local policies and ordinances, which are sometimes referred to as the local enabling environment, may not be aligned with adopting resilience goals and strategies. For example, native plant rain gardens, which help reduce neighborhood flooding, may be illegal (or may appear to be illegal by code enforcers) according to a municipality’s weed ordinance. In this case, the “enabling environment,” or local policy, is not aligned with a resilience goal (e.g., reducing neighborhood flooding).

- Historically, there has been a lack of coordination and collaboration between community residents, public employees, private businesses, and governmental institutions when making stormwater management decisions. More specifically, residents are often not engaged in decisions that affect their community. This fuels resident distrust of their local governments, which makes it difficult for local municipalities to advance a priority or project, regardless of the sincerity of their motives and the merits of a given project.

- Flooding risks, the costs of implementing flood mitigation projects, and the resulting benefits of those projects are spread across many public and private actors and political jurisdictions. This is problematic because the ways in which communities allocate taxes and legal responsibility for managing stormwater and coordinate with neighboring municipalities (or not coordinate) often does not align with how water actually flows within a community and across jurisdictions. For example, basement backups in private homes might be caused by an undersized public sewer. Conversely, flooding in a neighborhood’s public right-of-way may be caused by the cumulative runoff and wastewater originating from private properties. Similarly, excess runoff from an upstream community might exacerbate flooding in a downstream community. In this case, the most cost-effective solution to the downstream community’s flooding issues might be to do a collaborative project with their upstream neighbors, in which the costs and benefits are equitably shared. Building community resilience will require such inter-jurisdictional partnerships.

- Community residents, local businesses, and municipal governments are often financially strained and juggling multiple priorities at once. This often results in decisions being made based on austerity rather than what would produce the most long-term value.
Government Capacity and Funding Potholes:

In addition to these structural roadblocks, local governments also face a variety of capacity and funding potholes that make it difficult to plan, design, and implement flooding solutions. These capacity potholes—although complex in nature—are less deeply rooted than structural roadblocks and can potentially be resolved through strategic short-term (one - two years) and medium-term (two - six years) actions.

The following capacity and funding potholes affect local governments in the Calumet Corridor:

- A general lack of the funding, time, personnel, equipment, and technical expertise that is necessary to implement and manage flood mitigation projects and programs

- Lack of time to consider creative financing and project implementation strategies

- It is often difficult to identify and secure funding and financing for priority projects

- Lack of political support to raise taxes and/or adopt fees necessary to invest in stormwater-related capital improvement projects and ongoing operations and maintenance (O&M) activities

- Federal funds are not always user-friendly, coordinated, or flexible, and are increasingly scarce and uncertain

- Support from foundations or non-governmental organizations—although critical—may provide short-term or one-time only assistance to jump start a project, but fails to build the local capacity necessary to maintain or manage a project in perpetuity

- Program- and theme-specific funding from external sources may not always align with the needs of a local community; for example, there may be ample funding available to catalyze an innovative project, program, or partnership that builds climate resilience, but funding for preliminary engineering, construction, community outreach and education, and ongoing support for operations and maintenance is hard to come by
Communities must take strategic, concerted, timely, and appropriately-scaled actions to overcome these roadblocks and capacity potholes. Without intervention, infrastructure systems will continue to degrade and the (mutual) relationship between residents and municipal staff could become increasingly stressed, and urban flooding problems will increase in their frequency and magnitude.

It is apparent that some residents and municipal staff throughout the Calumet Corridor suffer from hopelessness and frustration at the growing urban flooding crisis. However, experience from previous CNT/RainReady planning efforts has shown that it is possible to counteract hopelessness and reorient frustrations by channeling them through solution-oriented and collaborative planning processes that cultivate and leverage community action that drive effective flooding solutions. This RainReady Calumet Corridor Plan provides a roadmap to resilience that is achievable, inclusive, and urgent.

The RainReady Team recognizes the magnitude of the task ahead. Overcoming the physical factors that contribute to urban flooding in the midst of structural roadblocks and capacity potholes will take a significant investment of financial, social, and political capital. It will also require a willingness on the part of residents, staff, and elected representatives to reconcile past disagreements (e.g., instances when residents were excluded from important decisions; instances where projects that would have benefited an entire community were thwarted by one individual’s or group’s political ambitions) and to work together towards a shared vision. When these groups come together, however, the restoration of the Calumet Corridor to a healthy, vibrant, connected, and beautiful place will set an example for the whole region.
THE PATH FORWARD

...okay, enough about the problem. We know we have a flooding issue.

What can we do?

A RainReady future for the Calumet Corridor is well within reach. In fact, each of the six communities in the Calumet Corridor possess the foundational community assets, strengths, and know-how necessary to mitigate flooding AND achieve broader community goals.

Through this planning process, the RainReady team discovered that residents, municipal staff, and elected representatives are more aligned in their shared desire to resolve local flooding issues than previously thought. We also learned that many local planners and community leaders have been implementing creative resilience-building projects for years, which other communities around the nation could learn from. Perhaps most encouraging, we learned that—in spite of chronic urban flooding issues (and other community concerns) and seemingly intractable roadblocks and potholes—residents in the Calumet Corridor continue to have an unwavering desire to improve the communities they call home. This individual resilience and drive will serve as the foundation on which all the other strategies and actions in this plan will build upon.

RAINREADY SOLUTIONS THAT DRIVE GREATER COMMUNITY RESILIENCE

Although focused on mitigating urban flooding, the RainReady solutions (i.e., goals, strategies, actions) presented in this plan are designed to address more than just flooding.

For example, streets and alleyways can be resurfaced in a way that not only reduces the wear-and-tear on cars and provides multiple transportation options (e.g., driving, walking, biking, transit), but also reduces street flooding. Front yards can be landscaped in way that not only beautifies the neighborhood and increases property values, but also reduces the risk of basement backups. Commercial corridors can be activated in a way that not only brings more shoppers (and tax revenue), but also reduces the stress on local sewers and creates a ‘sense of place’ that cultivates community pride. Industrial centers can be redeveloped in a way that not only creates new jobs, but also reduces flooding in the surrounding neighborhoods. The list goes on.

Put broadly, RainReady solutions build community resilience.
There are many individuals, communities, businesses, institutions, and systems that will be involved in implementing this RainReady Calumet Corridor Plan and building community resilience. Moreover, resilience is a very broad planning concept and encompasses a very wide array of dimensions and possible paths forward. The CNT/RainReady project team therefore developed a simple way to think about RainReady solutions and how they may drive greater community resilience, the Three R’s Approach.

The Three R’s Approach frames the goal of achieving greater community resilience—in the midst of urban flooding, structural roadblocks, and capacity potholes—in terms of these three broad goals:

- (Re)orient communities. Put communities on a path towards greater resilience by reorienting day-to-day operations and long-term planning.
- Repair existing infrastructure. Establish modernized infrastructure systems that allow communities to survive and thrive no matter what shocks and stresses they face.
- Retrofit the landscape. Create beautiful communities by converting impervious surfaces into natural landscapes, installing new green, grey, and green-grey infrastructure, and restoring natural areas.

Ultimately, this RainReady Calumet Corridor Plan is a road map to a more resilient future that can be used by community residents, municipal staff, elected officials, and regional partners. This plan can help mobilize the necessary financial, technical, political, and community resources necessary to achieve each community’s goals. What exactly a resilient future looks like was defined by the communities. The RainReady project team simply helped outline how to get there.
Plan

1. Identify community priorities, concerns, and goals
2. Create (local) Steering Committee and (regional) Advisory Committee
3. Synthesize community goals with RainReady Solutions
4. Identify stakeholders and build partnerships
5. Identify and screen funding, financing, and implementation strategies
6. Develop RainReady Plan and priority recommendations

Operate, Maintain, and Monitor

7. Bundle projects as needed (based on implementation strategies)
8. Pursue relevant funding, financing, and other implementation strategies
9. Conduct siting studies, technical studies, environmental reviews, permitting
10. Close the deal and develop implementation and maintenance plan
11. Implement projects/programs in phases
12. Complete Phase 1 (Pilot) → Phase 2 (Connect) → Phase 3 (Scale Up)
13. Document, inspect, rehabilitate (where necessary), and maintain infrastructure
14. Monitor and evaluate performance of projects and programs
15. Adapt ongoing implementation activities based on monitoring data

Implement

ON GOING: Project Enabling Activities (#9)

Operate, Maintain, and Monitor (Post-Development Phase)

FIGURE RR-9: The Path Towards Resilience
How to Approach Financing RainReady Communities

A CORRIDOR OF MODERATE INCOME COMMUNITIES HAS ASSETS

The path forward for resilience in the Calumet Corridor requires a new look at assets within each community.

Median single family home property values in the Calumet Corridor range from $71,900 in Robbins to $118,800 in Blue Island; median income ranges from $23,614 per household per year in Robbins to $47,050 in Calumet Park; mean income from $37,568 in Robbins to $55,753 in Dolton; and land area ranges from 734 acres in Calumet Park to 4,675 acres in Calumet City. Most dwellings are in either single family or two to four unit buildings with a relatively high homeownership rate.

These communities clearly vary in land coverage, in household income, and in the value of their property. In the aggregate, residential property alone has a market value of at least $4.67 billion. Aggregated household income is on the order of $1.92 billion.

How can these resources help secure funding for flood protection in the Calumet Corridor communities?

THE COST OF A TYPICAL RESIDENTIAL DEAL

Typical residential flood protection retrofits cost $8,000 per dwelling unit. Given the typical incomes in the Calumet Corridor towns and villages, it is not likely that households have the savings and ability to pay cash to get the necessary green infrastructure and plumbing work done. If home equity financing is available, the cost to amortize $8,000 presuming a 5 percent interest rate and a 15-year term is $63.27 per month. This amount would cost the average Dolton homeowner 1.4 percent of their monthly income, but in Robbins that would be 2 percent or more. It is also more likely that a lender would be willing to extend such credit in Dolton or in Calumet Park than in Robbins or Blue Island, given the typical property values and incomes. If credit cards are an option, most households in these income ranges are likely to take five years to pay off the principal and interest; the monthly expense in these cases could range from $190 at 15% interest to $216 at 21%, respectively.

While the cost of damages per flood event in Cook County is around $4,272 (RainReady Nation, CNT 2015), the risk of repeat flooding is high, and without

Summary of Housing and Land in the Calumet Corridor
intervention could amount to six to seven such events per decade. Denominated in aggregate damages, the payback for avoiding flood damages is deceptively attractive—but acquiring the resources to invest in the necessary protection could be an insurmountable barrier in such moderate income communities. In other words, homeowners may lack the upfront capital to invest in preventative solutions.

Our Calumet Corridor survey found average willingness to invest in flood protection at $2,210. Excluding for those homeowners who are unwilling or unable to pay at all, the median rises to $4,110. Beyond these figures, supplemental resources are needed.

There are several options for lowering the cost of flood protection and increasing access to credit.

**MINI-BONDS**

Municipal bonds are typically sold in denominations of $5,000 or more. A neighborhood in Denver, CO needed to raise $12 million for a combination of road, water main, and sewer improvements, and had just missed the deadline for the city’s every-five-years general bond issue. Neighborhood leaders suggested the City lower the face value of the bonds needed to $500 and sell them to the community itself. The city agreed to an experiment, offering an internet auction for one week only. The “opening bell” was rung on Monday morning at 8:30 am, and the entire issue sold out in 10 minutes. Mini-bonds were pioneered many years ago to make local improvements in conjunction with the Plan of Paris, and have been used in communities around the United States.

**SPECIAL SERVICE AREAS**

Various kinds of special service areas can be created by cities, towns and villages in Illinois. Such districts can be used for a wide range of purposes. Special service area (SSA) financing is a taxing mechanism used by a municipality or a county to finance additional services, improvements, or facilities desired in a certain portion of its jurisdiction (35 ILCS 200/27-5 (1994)). A municipality may have an unlimited number of special service areas, which may overlap entirely or partially. There are no minimum or maximum physical size requirements, although a special service area cannot consist of the entire jurisdiction of a governmental entity.

The nine steps required to establish an SSA are: adopt an ordinance proposing the establishment of the special service area; adopt a resolution at a public hearing to determine if and when a public hearing will take place to create the SSA; provide notice of the public hearing; conduct a hearing by the governing board; observe a 60-day waiting period to allow for petitions to block implementation; adopt the final ordinance; implement special service area; file documents with the County Clerk and Recorder within 60 days; and, if necessary, alter the special service area.

Once a special service area has been created, the preceding procedures may be utilized to enlarge the area, change the tax or debt limitations, alter the type of tax authorized for debt retirement, or extend the life of the special service area if it was limited to a fixed number of years.

**ON-BILL FINANCING**

Twenty five states, including Illinois, authorize the operation of Property Assessed Clean Energy or PACE financing for energy efficiency improvements.

We suggest here a variant, whereby municipalities borrow funds on behalf of local property owners and receive repayment over a period similar to the term of the bond, say 30 years. At a 5 percent interest rate, $8,000 on these terms would cost a property owner $42.95 per month.

This could be collected on either the water bill or on the property tax bill.
**DUE-ON-SALE FINANCING**

Park Forest, IL and other area municipalities offer home improvement loans with payment deferred until time of resale. Community Development Block Grant funds can be used for this purpose, as can the other financing sources listed in this section. The advantage to the borrower is that the benefit of flood protection is received immediately, while the repayment would occur out of property sale proceeds at time of settlement.

**50-50 FINANCING**

A typical arrangement for financing sidewalk repair is to split the cost between property owners and a municipality. The value to the property owner is accelerated repair. This method can be combined with any of the financing programs listed here. For example, the property owner’s share could be financed through on-bill repayment, lowering the cost to $23 per household per month in the example provided.

**GENERAL OBLIGATION FINANCING**

General obligation bonds (GO bonds) are used for general corporate municipal purposes and backed by the municipality’s full faith and credit.

Since full area flood risk reduction could require investments that cover both private property and the public realm, and any one block could easily have residential, commercial and public land uses included, a case could be made for issuing GO bonds for flood protection purposes.

**“TREE INCREMENT” OR TAX_INCREMENT FINANCING**

Most towns have permeable parkways, parks, yards and tree canopy that over time have fallen into disrepair. Studies by economists (Wachter 2004) and public interest organizations suggest that over time restoration of green infrastructure features can add substantial value to taxable property. A model for carrying this out was developed for Portland OR (http://www.cnt.org/sites/default/files/publications/CNT_PDXTreeAssetMgmt.pdf) and should be considered for application in the Calumet Corridor communities.

**FUTURE OPTIONS FOR FURTHER EXPLORATION**

- Property casualty insurers already offer discounts for good driving behavior including less driving, and health insurers lower premiums for increasing physical activity. We suggest that the Calumet Corridor communities collectively approach the Illinois Insurance Commissioner and leading insurers to explore such incentives.

- The Metropolitan Water Reclamation District was designated as Cook County’s stormwater management agency by the General Assembly, and is authorized to collect a millage to support flood protection investments. The corridor communities should explore a partnership with the MWRD that would help further lower the local burden of retrofit for stormwater management.

- Existing governmental units should be engaged in exploring these options, including options that are not limited to township government, school and community college districts, the Cook County Forest Preserve District, the Clean Water Revolving Loan Fund of the Illinois Environmental Protection Agency, local park districts, grants administered by the Illinois Dept. of Natural Resources, by the Illinois Department of Transportation, and the Chicago Metropolitan Agency on Planning (for example, the RainReady Midlothian Plan includes steps to partner with RTA and IDOT to provide green infrastructure resources around its Metra station).

For additional resources, consult Appendix C, Implementation Resources.
Creating this RainReady Calumet Corridor Plan was an ambitious undertaking. This plan would not have been possible without the participation, input, critique, and guidance from numerous community leaders and resource experts. Listed below are the various individuals, firms, agencies, and groups that contributed to the development of this plan.

This plan was funded by Cook County with Community Development Block Grant – Disaster Recovery funds (CDBG-DR). Cook County’s support for this plan demonstrates the County’s long-term commitment to building more resilient, economically competitive, and livable communities.

Over 2,100 community residents, municipal employees, elected officials, and regional experts were engaged throughout the fourteen month RainReady planning process.

To ensure that this plan is science-based and regionally-coordinated, the RainReady Community Team at the Center for Neighborhood Technology (CNT) partnered with the U.S. Army Corps of Engineers (USACE) and the South Suburban Mayors and Managers Association (SSMMA) to assist with planning, analysis, and implementation tasks. The RainReady Team also worked with Chicago Metropolitan Agency for Planning (CMAP) to learn from their Local Stormwater Planning Approach—a method CMAP developed to identify areas prone to urban flooding as well as potential locations for solutions—and to identify ways to coordinate stormwater planning efforts at a local and regional level.

Coordination and collaboration with other regional stakeholders—which is an essential ingredient to building community resilience at the regional level—was facilitated through the RainReady Technical Advisory Committee (TAC) and the Calumet Stormwater Collaborative (CSC).

In an effort to collect more targeted, community-specific information and feedback on plan recommendations and to jump start implementation efforts, the RainReady Team also organized a Steering Committee (SC) for each of the six Calumet Corridor municipalities (i.e., Blue Island, Calumet City, Calumet Park, Dolton, Riverdale, and Robbins).

These Steering Committees provided critical community-specific information regarding flooding risks and community priorities, as well as feedback on proposed plan recommendations for their specific municipality. These Committees are composed of community leaders—including people within and outside of local government—who will carry this plan forward.

A multidisciplinary Technical Advisory Committee (TAC) was also created to provide high-level input on plan recommendations and implementation strategies. The TAC included planning, policy, engineering, and community outreach resource experts.
VILLAGE OF BLUE ISLAND

STEERING COMMITTEE MISSION STATEMENT:
The Blue Island Steering Committee will create residential and commercial maintenance plans which include green infrastructure best practices that are fair and attainable for all Blue Island Residents.

STEERING COMMITTEE MEMBERS:
- Bridgette Poole Milner
- Jeremy Heyboer
- Judith Smith
- Lili Juskevice
- Marsha Lee
- Mary Carvlin
- Rachel Heyboer
- Tom Hawley, 1st Ward Alderman

CITY OF CALUMET CITY

STEERING COMMITTEE MISSION STATEMENT:
The RainReady Calumet City Steering Committee will work with residents, staff and elected representatives, to make Calumet City resilient through the use of green and grey infrastructure improvements in alleys, vacant lots, and the City’s expansive parking lots.

STEERING COMMITTEE MEMBERS:
- Frank Alexander, Emergency Service & Disaster Agency (ESDA)
- Jim Meincke, Emergency Service & Disaster Agency (ESDA)
- Joaquin Vazquez
- John Beckman
- Pete Saunders, Economic Development Coordinator
- Shirley Watson
VILLAGE OF CALUMET PARK

STEERING COMMITTEE MISSION STATEMENT:
Through the efforts of the RainReady Calumet Park Steering Committee, Calumet Park will no longer have homes, businesses, or public areas that flood. The tight knit community will be composed of well-maintained infrastructure, residents educated on flood resilience, and excellent response strategies in the case of an emergency.

STEERING COMMITTEE MEMBERS:
- Alma Earley
- Gailyn Hall
- Helen Reed
- Joyce Shaw
- Lisa Cowans
- Mary Ryan, Village Administrator, Village of Calumet Park
- Michelle Austin
- Ramona Austin
- Sandra Brown
- Shon Bailey, Foreman of Public Works
- Winnell Jones

VILLAGE OF DOLTON

STEERING COMMITTEE MISSION STATEMENT:
The RainReady Dolton Steering Committee will implement the RainReady Dolton Plan, incorporating green infrastructure installation and sewer maintenance. The Committee will beautify the village, create activities for youth, establish new employment opportunities, educate residents, and advocate for implementation of the new sewer maintenance plan. All of the goals of the Committee will be created with flood mitigation in mind.

STEERING COMMITTEE MEMBERS:
- Barbara Evans
- Barbara Lewis
- Bobby Evans
- Donna Gray
- Elizabeth Scott, Mayor’s Chief of Staff, Village of Dolton
- Jerome Gray
- Kevin Griffin
- Latonya Nalls
- Mary Evans
- Pearlie Lemons
- Terry Lewis
VILLAGE OF ROBBINS

STEERING COMMITTEE MISSION STATEMENT:
The RainReady Robbins Steering Committee seeks to raise the quality of life through economic development, education, and neighborhood beautification. The committee will work to create access to daily amenities by establishing businesses that attract residents to spend their money in Robbins and to attract visitors to do the same. The committee will also create recreational and community garden amenities in vacant and underused areas. A sense of place will be established through communication, beautification improvements, and activity building for youth and seniors.

STEERING COMMITTEE MEMBERS:
- David Bryant, Village Trustee
- Ernest Maxey, Village Trustee
- Sheila Jones
- Kathy Park
- Delean Fuller
- Carrie Smith
- Leila Ward
- Juanita Williams
- Barbara Pillow-Sidbeh
- Loretta Dowdy
- Lula Fulson
- Jacob Carrothers
- Jackie Henry
- Tasha Baker, Village Administrator, Village of Robbins
- Myrna Ratliff
- Leota Murphy
- David Dyson, Village Trustee
- Zachary Fulson
- Christell A. Jones
- Rosie Mitchell
- Joanna Rhodes
- Helen Echols
- Dave Moore
- Shirley Howard
- Melvin Bruton
- James C. Collier, Sr.

*Provided technical review of CNT/RainReady’s Community Flooding Risk and Opportunities Tool

NOTE: These lists above do not reflect the full number of people engaged through the planning and outreach efforts (e.g., community meetings, educational workshops, tours, stakeholder interviews).
Purpose of the RainReady Plan

Developing a plan is just one step on a community’s path towards resilience, but it is an important one.

A plan is an adopted vision for the future that is used to guide public and private actions in achieving that vision.

The purpose of this plan is to articulate a vision for more resilient Calumet Corridor communities (i.e., Blue Island, Calumet City, Calumet Park, Dolton, Riverdale, and Robbins) and to put these six communities on a path towards greater resilience through improved stormwater management, sustainable economic development, and integrated planning.

The RainReady/USACE (U.S. Army Corps of Engineers) project team (referred to as the “project team” hereafter) and municipal partners began developing this plan in February 2016 with the following objectives in mind:

- Establish a shared understanding of the scope, severity, and type of flooding risks across each community in the Calumet Corridor
- Achieve consensus on priority solutions that provide multiple benefits to the community
- Provide municipal and community leaders with a clear roadmap for plan implementation, including partners, funding and financing strategies, necessary policy changes, and local champions
- Where possible, advance existing planning and development priorities that align with the general principles of a RainReady community

THE PLANNING PROCESS
Guiding Principles

The following lists explicitly state the guiding principles that shaped how the RainReady Project Team framed problems, worked with communities, and designed solutions.

10 RainReady Guiding Principles:

1. Easily Implementable, Replicable, and Scalable Solutions
   We work to ensure that our projects, programs, and partnerships can be widely and quickly adopted by towns and cities across America.

2. Market-Based Approaches
   RainReady solutions meet the needs of individual property owners and renters by leveraging public, private, and public-private investments to ensure the biggest bang for the public’s buck.

3. Community-Wide Efforts
   We bring efficiency savings by serving the whole community and addressing the multifaceted mix of flooding problems that residents and business-owners face.

4. Evidence Based Plans
   The projects, programs, policy-changes, and partnerships we recommend are prioritized based on a robust analysis of the risks and opportunities communities face.

5. Affordable and Fair Programs
   RainReady solutions can benefit everyone, wealthy and poor.

6. Multi-Scale Solutions
   Flooding problems occur at many scales, and thus action is needed at all scales - from individual homes, to neighborhoods, to municipalities, regions, states, and the nation.

7. No Negative Downstream Impacts
   Our solutions are designed to avoid simply displacing flooding problems to neighboring homes and downstream communities.

8. Nature-Based (i.e., "Green Infrastructure") Solutions
   We advocate using green infrastructure solutions as often as possible since they have been shown to bring a wider array community benefits than large-scale, engineered fixes.

9. Fiscal Fairness and Transparency
   All properties generate stormwater runoff, so everyone should help pay for the services and systems necessary for managing it.

10. Preventative Measures
    We promote the adoption of local ordinances, permits, incentives, educational programs, and infrastructure projects that anticipate various shocks and stresses and prepare for them.

The RainReady Team has adopted these principles, because they have been shown to be effective at putting communities on a path towards resilience. When put into action through policies, programs and projects, these guiding principles elevate high value projects, strengthen economic vitality and improve equity and quality of life for all community members.
Planning and Outreach Approach

The RainReady Calumet Corridor Plan is a community- and data-driven plan that is based on several guiding principles for building sustainable and equitable communities (See Figure RR-11). These principles and the associated RainReady Community planning process were developed through prior RainReady planning efforts in the Village of Midlothian and several Chicago neighborhoods. They have been shown to deliver innovative, effective, and game-changing solutions for communities struggling with urban flooding.

This plan was developed through a 15-month process that consisted of three phases: 1) Risk and Opportunity Assessment, 2) Solution Mapping, 3) Implementation Support, and 4) Monitor & Adaptation (See Figure RR-13). During each of these phases, project tasks were organized into three main workflows: 1) Data Collection, Analysis, and Visualization, 2) Community Outreach and Education, and 3) Planning Deliverables.

The planning process was iterative and collaborative. For example, data on known flooding risks was collected and printed on large format maps. These maps were then used in collaborative community meetings that were designed to gather additional input on flooding risk and preferred solutions from local residents, municipal staff, and elected representatives. This community input was fed back into our analytical and mapping tools, which were used to generate draft planning recommendations. These draft planning recommendations were then distributed to each community’s Steering Committees (SC) and the Technical Advisory Committee (TAC). Final recommendations were refined based on input from these two groups and any additional information that came to light through the planning process.

The goal at the outset was to develop a plan that synthesizes and reconciles quantitative data on each

community’s existing physical and hydrological conditions with community-driven input, such as what kinds of solutions are preferred and where. The purpose for balancing quantitative data with community input was to ensure that we did not recommend a project that, while physically and hydrologically feasible and cost-effective, is not grounded in what the community actually wants. Conversely, we also wanted to ensure that we did not recommend a project that is neither physically feasible nor cost effective. Either of these two scenarios would result in recommendations that are not implementable.

The Rain Ready Community Team worked with local communities to deliver a full range of community planning services (Figure RR-12).

The timeline and corresponding descriptions below describe the RainReady Calumet Corridor planning process, including the project’s key milestones and deliverables.

**PHASE 1: RISK AND OPPORTUNITY ASSESSMENT**

This RainReady planning process began with an assessment of urban flooding risks, community concerns, and solution opportunities (See the community-specific chapters for a summary of this information). Given the Calumet Region’s planning-rich context, this initial risk and opportunity assessment built upon previous ongoing regional and local planning efforts. The assessment also incorporated information gathered from stakeholder meetings, maps, and existing data indicating known flooding problem areas.

**KEY PHASE 1 MILESTONES AND DELIVERABLES:**

- The CNT/USACE project team organized and Project officially kicks off
- All six municipal kickoff meetings completed
- RainReady Community Survey and mailers finalized and distributed to 41,529 homes in the Calumet Corridor
- 100+ plans inventoried, 160+ Resilience Opportunities Assessed, and known flooding risks mapped; Information packaged into Risk and Opportunity Assessment/ Geodatabase
- All six Community Resilience Snapshots published and distributed to community partners

![RainReady Project Timeline](image-url)
PHASE 2: SOLUTION MAPPING

Once the existing conditions on flooding risks and resilience opportunities were documented and packaged into the Risk and Opportunity Assessment/Geodatabase and the Community Resilience Snapshots, the project team used this information to create materials for collaborative Community Meetings, Educational Workshops, and City/Village Board Presentations. The RainReady project team also worked with CNT’s Urban Analytics Team to iteratively develop and refine CNT’s Resilience Planning Tool (Version 1.0) (Figure RR-14). This tool serves as an assessment and solution mapping resource that: 1) identifies flood-prone areas, 2) maps information related to hydrology, environmental conditions, transportation infrastructure, political jurisdictions, and economic development in the Calumet Corridor, and 3) enables the rapid and iterative testing of different green infrastructure solution alternatives.

KEY PHASE 2 MILESTONES AND DELIVERABLES:

- All six Community Meetings completed
- All seven Educational Workshops completed
- City/Village Board Meetings initiated to share preliminary findings and recommendations
- Two Steering Committee Workshops held, over 50 Steering Committee members are trained and recruited
- CNT/RainReady Resilience Mapping Tool Version 1.0 complete
PHASE 3: PLAN DEVELOPMENT AND IMPLEMENTATION SUPPORT

In Phase 3, community input, gathered through the various Community Meetings and other public engagement events, was fed into the CNT/RainReady Resilience Mapping Tool. The project team led Educational Workshops to help build local capacity and equip local residents to participate in and contribute to this planning process in meaningful ways. For example, we trained residents in the basics of green infrastructure through presentations and site visits so that they can identify what kind of green infrastructure solutions they would like to see in their communities. Community input gathered from the Steering Committees, expert input gathered from the Technical Advisory Committee, and outputs from the CNT/RainReady Resilience Mapping Tool (i.e., maps, quantitative analysis, data summaries) were used to develop preliminary plan recommendations (e.g., vision statements, mission statements, goals, strategies, and actions). These preliminary recommendations were then redistributed back to the SCs, the TAC, and other partners and refined. The key deliverable from Phase 3 was the final plan, which was both community-driven and analytically rigorous.

KEY PHASE 3 MILESTONES AND DELIVERABLES:
- Approximately 15 preliminary priority projects identified
- Draft RainReady Calumet Corridor plan completed and distributed for internal review
- Draft plan distributed to Steering Committees, Technical Advisory Committee, and other partners
- Final RainReady Calumet Corridor completed, planned launch event
- Ongoing implementation support initiated
**PHASE 4: MONITORING AND ADAPTATION**

Monitoring the performance of projects and programs, evaluating that monitoring data, and adapting municipal management operations and capital improvement implementation efforts based on what you learned are critical steps for building resilient communities. We live in an increasingly uncertain and complex world and no planner can ever anticipate every possible scenario for the future. Plans—although they are often translated into static documents, maps, and graphs—must therefore be living documents that adapt to constantly changing conditions. Community leaders (e.g., residents, municipal staff, elected representatives) must adapt how they implement a plan, whether that occurs through community-driven projects, changes to policy and ongoing municipal operations, or long-term capital improvement projects.

Communities should take Phase 4: Monitoring and Adaption seriously in order to continually improve and move forward on their path towards greater resilience. Given the scope of this project and time constraints, the RainReady project team was unable to offer ongoing monitoring and adaptation support to the Calumet Corridor communities through this planning process. However, the recommendations proposed in this plan embed the processes of monitoring and adaptation.

**PLANNING AND OUTREACH ACTIVITIES BY-THE-NUMBERS:**

- **Over 2,100** community residents, municipal employees, elected officials, and regional resource experts engaged through the RainReady Planning Process
- **584** RainReady Surveys Completed (NOTE: analysis in this plan was based on 564 surveys)
- **55** Stakeholder Meetings attended by the RainReady project team
- **83** Community Outreach events hosted by the RainReady project team
- **Two mailers** sent to 41,529 homes in the Calumet Corridor
- **Four** Public Service Announcements
- **64** people attended a RainReady Workshop (i.e., Leaders Training and Educational Workshops)
- **602** doors knocked in local outreach
- **Five** Calumet Corridor residents hired to conduct outreach
- **26** resource experts engaged in the Technical Advisory Committee (TAC)
- **One** Technical Advisory Committee meetings held
- **Six** Community Steering Committees established with 78 community leaders
- **24** Community Steering Committees held to date
- **One** interactive website created
Ultimately, the main deliverable from this planning process is the document you are reading right now, the RainReady Calumet Corridor Plan. However, this plan is not the only result of everyone’s effort. In fact many projects were well underway even before this plan was finished.

From the start, this program was designed to be an implementation-focused planning process. That means, the RainReady project team balanced its intent to create a community-driven and analytically rigorous plan with its efforts to be pragmatic and advance priority projects as opportunities arose. Therefore, activities like participating in project/site planning meetings, advancing existing priorities through the RainReady meetings, submitting grant proposals, and advocating for the implementation of previously-identified priority projects that were aligned with the project team principles, were key components of the planning process.

The decision to take an implementation-focused approach to this planning process was informed by the planning context of the Calumet Corridor and broader Calumet and Southland Regions. Put simply, there are many plans that have been completed for the Calumet Corridor communities and region. So many, in fact, that “planning-fatigue” and the perceived lack of implementation efforts was a very real concern among our municipal partners and community residents.

We learned there was a need for: a more complete understanding of flooding challenges and potential solutions, the capacity to plan and implement projects in a coordinated fashion, and the ability to leverage the necessary funding, political, and community resources, and target those resources at the right projects and the right time. In light of these gaps, the project team embraced an implementation-focused approach to not only deliver a plan document, but also to help build the local capacity necessary to put the plan into action.
THE CALUMET REGION AND THE CALUMET CORRIDOR

Few places weave together nature, people, and industry as distinctively as the Calumet Region. Glaciers, Native Americans, pioneer settlers, railroaders, industrialists, highway builders, and suburbanization have all left their mark on the landscape. Understanding the Calumet Region’s rich history is critical for charting a path forward towards a more resilient future.

LOCATION

The Calumet Corridor is a sub-region within the broader “Calumet” and “Southland” Regions that are comprised of six communities: Blue Island, Calumet City, Calumet Park, Dolton, Riverdale, and Robbins. The Calumet Corridor has served as a major manufacturing and transportation hub for nearly two centuries due to its proximity to the City of Chicago and Northwest Indiana, its land and water resources, and its access to all modes of transportation. The Calumet Corridor’s location continues to be one of its most important assets and provides a foundation for future development.
The Calumet Region weaves together neighborhoods, open space and natural areas, shopping and business districts, industrial areas, and transportation corridors like a tapestry. If you take a deep look into the history of any particular place in the Calumet Corridor, you will uncover a complex story marked by cyclical waves of economic growth, conservation, collapse, and revitalization. These economic cycles have resulted in the layering and juxtaposition of old and new features and natural and built environments that are unique to the Calumet Region.

A BRIEF ECONOMIC AND SOCIAL HISTORY OF THE CALUMET CORRIDOR

Historically, the Calumet Region has been closely linked with heavy industry. The abundance of railroads and waterways that traverse the region supported the establishment of steel mills, oil refineries, bulk materials handlers, and other industries (often adjacent to or near waterways). These industries provided a wealth of jobs and community building opportunities for municipalities along the Calumet Corridor, especially in Blue Island, Dolton, and Riverdale.

Over the past 45 years, however, the region’s economic base, number of skilled jobs and other opportunities have declined, due to changes in national and international markets and manufacturing technologies. Making matters worse, the Great Recession of 2008 resulted in many homeowners falling “underwater” on their mortgage payments (meaning the amount of a homeowner’s mortgage is more than the value of their property), putting them at risk of foreclosure. When chronic flooding issues enter the picture (see The Problem) the financial burden becomes more than many homeowners can shoulder. This has created a situation in which some homeowners feel trapped in their homes or, in some cases, are driven to simply abandon their homes, seeking greener and dryer pastures.

Residents involved in this RainReady planning process have expressed concerns about higher crime rates, and diminishing accessibility to and quality of social services, public education, and public health services. Addressing
these community concerns are not within the scope of this plan. However, we feel it is important to acknowledge these broader challenges and, where possible, design flooding solutions that can help communities address them. For example, this plan outlines strategies for investing in infrastructure improvements that create local jobs, and building green school yards that create more youth opportunities for outdoor recreation and environmental education.

Although serious economic and social challenges exist, the Calumet Corridor boasts numerous economic, social, and environmental assets and proactive citizens (residents, municipal staff, and elected representatives) who are committed to improving their communities. Some of the key regional assets identified through this planning effort are listed in Figure RR-16.

---

**FIGURE RR-16:**
Key Regional Assets

<table>
<thead>
<tr>
<th>Assets</th>
<th>Description and Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transit-Oriented Development (TOD) and Cargo-Oriented Development (COD) opportunities</td>
<td>There are 10 Metra Stations (six in Blue Island, one in Calumet Park, one in Robbins, two in Riverdale. There are five large COD Zones that overlap with Calumet Corridor. Most of these existing TOD/COD existing sites have ample development potential.</td>
</tr>
<tr>
<td>Proximity to Chicago</td>
<td>The Calumet Corridor is approximately 20 miles south of downtown Chicago.</td>
</tr>
<tr>
<td>Access to jobs via transit</td>
<td>On average, 577,491 jobs are accessible within a 30 minute transit commute for households in the Calumet Corridor.</td>
</tr>
<tr>
<td>Community access to transit</td>
<td>On average 35.2% of the people in the Calumet Corridor reside within a half mile of a transit stop.</td>
</tr>
<tr>
<td>Developable land and properties located on commercial streets</td>
<td>All of the Calumet Corridor communities have land and properties available along commercial corridors.</td>
</tr>
<tr>
<td>Funding, financing, and tax incentives programs</td>
<td>There are a variety of tax and funding incentives that are available to catalyze industrial, commercial, residential, and mixed use developments. For example, Tax Increment Financing Districts (TIFs), Special Business Districts, Growth Zones, Brownfield Redevelopment and Intermodal Promotion Act (BRIMPA), New Market Tax Credit Zones, and other incentives can be leveraged by investors and developers.</td>
</tr>
<tr>
<td>Schools and universities with a mission to educate and equip a workforce with the skills needed for an ever-changing economy</td>
<td>There are several nearby colleges, universities, and trade schools within the Southland Region that prepare local residents for jobs in the region (e.g., South Suburban College, Moraine Valley College, Governors State University, Chicago Community Colleges).</td>
</tr>
<tr>
<td>Deep respect for and desire to celebrate cultural and community heritage</td>
<td>Celebrating Robbins' historic African American identity (e.g., Tuskegee Airmen) is a key consideration for residents and Village staff for any planning and development effort.</td>
</tr>
<tr>
<td>Historical neighborhoods that have housed families for generations</td>
<td>Many families have lived in their communities for multiple generations. Community members often cited the aesthetics of older neighborhoods (e.g., “tree-lined streets,” and “beautiful and uniformed architecture”) as a community strength.</td>
</tr>
<tr>
<td>Engaged community residents and organizations</td>
<td>Community groups like Blue Island’s Resident Action Group, Riverdale’s Organization for Change (ROC), and numerous other block clubs, church groups, youth groups, and other community organizations are actively engaged in efforts to improve their community’s homes, places of worship, and neighborhoods.</td>
</tr>
<tr>
<td>An abundance of ecologically-significant natural areas</td>
<td>There are approximately 820 acres of natural areas of statewide significance that are either within or immediately adjacent to the Calumet Corridor communities.</td>
</tr>
<tr>
<td>Access to Lake Michigan, one of the world’s largest sources of freshwater</td>
<td>The Great Lakes hold about 21% of the world’s fresh water.</td>
</tr>
</tbody>
</table>

---

Note: Community-specific assets are mapped and discussed in the community-specific chapters.
In light of the regional assets (Figure RR-16), and many others that are not listed, the RainReady Community Team believes that Blue Island, Calumet City, Calumet Park, Dolton, Riverdale and Robbins are well positioned to take advantage of these tremendous regional strengths and realize a true revitalization of their neighborhoods, business districts, and communities.

SUMMARY OF KEY ACTORS, PLANS, AND POLICIES

The political landscape of the Calumet Corridor is as rich and varied as the region’s physical landscape. Dozens of local, regional, state, and federal organizations, agencies, and firms—each of which has its own jurisdiction and geographies—are actively engaged in shaping the region. Each of these governing bodies, and their staff, brings a unique set of resources (e.g., funds, technical assistance, and administrative know-how) and legal mandates (the responsibility to do something), which can be used to advance a project.

In such a planning-rich context, it is critical to begin any effort by learning what plans, policies, and ordinances are relevant for a given project and where communities can secure the necessary resources for implementation. Therefore, building the capacity of residents, municipal staff, and elected representatives to collectively navigate complicated decision-making processes, mobilize and engage the right stakeholders, and acquire the necessary funding and other resources is key to building stronger, more resilient communities.

To help readers and users of this plan understand and navigate the complex political and economic context of the Calumet Corridor, we created the following four tables:

- Figure RR-17. Political Jurisdictions with Cultural and Natural Geographies of the Calumet Region (geographic analysis)
- Figure RR-18. Key Actors by Sector (stakeholder analysis)
- Figure RR-19. Key Regional Plans (plan review)

### FIGURE RR-18:  
Key Actors by Sector and Governance Level  
(i.e., Stakeholder Analysis)

Through this planning process, RainReady reviewed over 100 plans, policies, and studies, including CMAP’s GO TO 2040 Comprehensive Regional Plan (and forthcoming ON TO 2050 plan), the Millennium Reserve Plan, Local Technical Assistance (LTA) plans and the Metropolitan Water Reclamation District of Greater Chicago’s (MWRD) Detailed Watershed Plans (DWP) and forthcoming Phase 2 Stormwater Master Plan. The purpose of such an extensive plan review was to avoid “reinventing the wheel” in terms of possible solutions, and to identify opportunities to build on and advance previously proposed ideas and community priorities.

This RainReady planning process also coordinated and aligned with these key regional planning and coordination efforts in the Calumet Corridor, where it was appropriate:

THE CALUMET STORMWATER COLLABORATIVE

The Calumet Stormwater Collaborative (CSC) is facilitated by the Metropolitan Planning Council (MPC) and comprised of the key stakeholders managing land, infrastructure, financing tools, or regulatory powers related to stormwater management in the Calumet Region. The CSC began as one of the first priority projects of the Millennium Reserve in light of the need for better communication and coordination around stormwater planning and implementation efforts. The CSC addresses three central problems:

- Stormwater overwhelms current infrastructure
- Green infrastructure’s role in stormwater management is still taking shape
- Coordinated action between government units and other stakeholders controlling land, infrastructure, financing tools and regulatory powers is necessary to solve systemic problems in systemic ways

The CSC has been invaluable in facilitating coordination with stakeholders and partners throughout this planning process. The RainReady educational workshops, hosted throughout the summer of 2016, were a shared product of the CSC.

The CSC, its member organizations, and its work products (e.g., Planning and Policy Resource Repository, educational materials, modeling and data tools, etc.) are all valuable resources for coordinating stormwater planning and implementation efforts in the Calumet Region.

THE CHICAGO METROPOLITAN AGENCY FOR PLANNING’S GO TO 2040 COMPREHENSIVE REGIONAL PLAN

GO TO 2040 is Metropolitan Chicago’s comprehensive regional plan for sustainable prosperity in its seven counties and 284 communities. The Chicago Metropolitan Agency for Planning (CMAP) has begun developing a new comprehensive plan to succeed GO TO 2040. CNT is contributing to this effort on a variety of topics, including stormwater, resilience, green infrastructure, climate mitigation, working in vulnerable communities, and transit-oriented development (TOD).

COOK COUNTY’S APPLICATION TO THE U.S. DEPARTMENT OF HOUSING AND URBAN DEVELOPMENT’S NATIONAL DISASTER RESILIENCE COMPETITION

In 2015, the State of Illinois, Cook County, DuPage County, and the City of Chicago, each applied to the U.S. Department of Housing and Urban Development’s (HUD) National Disaster Resilience Competition (NDRC), a large grant program for resilience initiatives. Though none of the applications were accepted, they provided a foundation for resilience priorities. In fact, many of Cook County’s 2015 project proposals were refined and advanced through RainReady Planning Process.

THE METROPOLITAN WATER RECLAMATION DISTRICT OF GREATER CHICAGO’S PHASE II MASTER PLAN

The Metropolitan Water Reclamation District of Greater Chicago (MWRD) is an independent government and taxing body serving approximately 91 percent of Cook County. Its mission is to protect the health and safety of the public, protect the quality of the water supply source (Lake Michigan), improve the quality of water in watercourses in its service area, protect businesses and homes from flood damages, and manage water as a vital resource for its service area.
The MWRD has finalized a Stormwater Master Plan in the Little Calumet River/Calumet-Sag Channel Drainage Area, which incorporates portions of Blue Island, Calumet Park, Riverdale, and Robbins. The final Plan includes concept memos for known problem areas in four of the six communities in the Calumet Corridor. Where appropriate, the RainReady Calumet Corridor Plan builds on the recommendations put forth in these concept memos. The MWRD also worked closely with Cook County on the aforementioned NDRC application and is the lead agency on several projects within the Calumet Corridor. The RainReady team works closely with the MWRD to coordinate planning efforts and advance stormwater projects in the Calumet Corridor.

MILLENNIUM RESERVE GREEN INFRASTRUCTURE PROJECT

Between 2014 and 2015, Chicago Wilderness undertook a green infrastructure planning process for 36 communities within the Millennium Reserve - Calumet Core. The goal of this process was to increase awareness of natural assets and build a foundation for long-term natural resource protection and stewardship.

Through this process, Chicago Wilderness established:

- a map of the core green infrastructure networks throughout the Millennium Reserve
- a map of key “Opportunity Areas” suitable for localized green infrastructure strategies, which were identified through community workshops over a 12 month period
- increased capacity within local communities to understand the impacts of climate change and implement green infrastructure strategies

The plan established several foundational concepts around which the Cook County NDRC application and this RainReady Calumet Corridor Plan were built.

There is a long and rich history of planning and action in the Calumet Region and, despite reviewing more than 100 documents, this is not exhaustive.
The six communities within the Calumet Corridor are subject to a variety of regulations impacting stormwater runoff and water quality. Federal, state, and county regulations apply universally to each of the six communities. Each municipality also has its own set of local codes and ordinances that impact the water within it.

The regulatory environment within which the residents, business owners, and developers of the Calumet Corridor operate will impact the path to RainReadiness. This section provides an overview of the regulations that apply to floodplain and stormwater management, water quality, land use planning, development, site planning, and building codes. Through this review, we can identify the existing regulatory tools that encourage better stormwater management as well as opportunities to improve or instate new regulations that encourage the use of green infrastructure and other water infrastructure best management practices (BMPs).

**FEDERAL REGULATIONS**

The federal regulations with the most “teeth” (or regulatory power) to manage flooding and stormwater in the Calumet Corridor include the Clean Water Act of 1972, as amended (33 U.S.C. §1251 et seq.), and the National Flood Insurance Act of 1968, as amended (42 U.S.C. 4001 et seq.).

**THE CLEAN WATER ACT**

The Clean Water Act, officially the “Federal Water Pollution Control Act,” was the first federal statute established to protect the natural waters of the United States. It aims to “restore and maintain the chemical, physical, and biological integrity of the Nation’s waters” and remains the most important federal statute on water protection.

The Clean Water Act sets guidelines for the release of polluted water into natural waters, and establishes water quality standards for rivers, lakes, and wetlands. Within the Calumet Corridor, the Clean Water Act is responsible for the National Pollutant Discharge Elimination System (NPDES) Program, which dictates that a permit be secured wherever treated effluent and stormwater are released into waterways. The Clean Water Act also regulates the nature of fill material that can be placed in waterways and wetlands.

The United States Environmental Protection Agency (USEPA) administers the majority of the Clean Water Act Regulations. However, the State of Illinois has administered the NPDES program since 1977, and the USACE administers Section 404, which pertains to the placement of fill material into the navigable waters of the U.S. and associated wetlands.

**THE NATIONAL FLOOD INSURANCE ACT**

The National Flood Insurance Act authorizes the National Flood Insurance Program (NFIP), which is administered by the Federal Emergency Management Agency (FEMA). The NFIP aims to reduce the impact of riverine flooding on private and public structures. It does so by providing affordable insurance to property owners and by encouraging communities to adopt and enforce floodplain management regulations to reduce flooding on new construction.
Although voluntary, most communities participate in the NFIP because municipal participation in the program is required in order for property owners to insure their structure under the NFIP. This insurance is often required to secure a mortgage within the designated Special Flood Hazard Area (SFHA), defined by FEMA. To participate in the program, communities are required to adopt local floodplain management ordinances which ensure that new floodplain development is built to reduce flood risk and does not increase flood risk in other areas. Although the NFIP is administered by FEMA at the national level, individual communities are required to enforce their adopted floodplain ordinances.

FEMA established the voluntary Community Rating System (CRS) Program to encourage communities to go above and beyond the minimum requirements under the NFIP. CRS-participating communities implement actions to reduce flood damage through additional floodplain regulation, educational programs, and taking a comprehensive approach to floodplain management.

When communities opt in to CRS, flood insurance premium rates are discounted within the participating community, reflecting the reduction in risk associated with their actions. Within the Calumet Corridor, all six communities participate in the NFIP, but only Calumet City is currently participating in the CRS program.

Other federal regulations that impact the waterways of the Calumet Corridor are listed below.

- **National Environmental Policy Act (NEPA):** Requires federal agencies to assess the environmental effects of their proposed actions prior to implementation. Agencies also provide opportunities for public review and comment on those evaluations.

- **Safe Drinking Water Act (SDWA):** Protects the quality of drinking water in the U.S. This law focuses on all waters actually or potentially designed for drinking use, whether from above ground or underground sources, and is administered by the EPA.

- **Rivers and Harbors Act of 1899:** Protects navigation and regulates dredging and filling of the nation’s waters by requiring a permit for any project that proposes erection of structures or other work in navigable waters. In the Calumet Corridor, the Calumet River, the Little Calumet River, and the Calumet-Sag Channel are listed as “navigable waterways” and are subject to this legislation, which is administered by the USACE.

- **Fish and Wildlife Coordination Act:** Protects fish and wildlife when federal actions result in the control or modification of a natural stream or body of water. The act requires a consultation with the U.S. Fish and Wildlife Service (UFWS) and Illinois Department of Natural Resources (IDNR) where any body of water is controlled or modified by any Federal agency.
STATE OF ILLINOIS REGULATIONS

Within the State of Illinois, the most important regulation for managing flooding and stormwater within the Calumet Corridor is the Rivers, Lakes, and Streams Act (RLSA). Under RLSA, the Illinois Department of Natural Resources (IDNR) Office of Water Resources (IDNR/OWR) regulates construction activities in floodplains. This includes regulating activities that may restrict a stream’s capacity to carry flood flows and result in channel instability and increased flood damages to neighboring properties. In other words, construction activities must be reviewed for their potential to increase flooding.

IDNR requires permits for any construction within a public body of water and for construction within floodways. Permits are required for construction projects in floodways of 1) streams in urban areas with drainage areas of one square mile or more and 2) streams in rural areas with drainage areas of ten square miles or more. In Cook County, the MWRD reviews permits.

The State of Illinois Environmental Protection Agency (IEPA) administers the NPDES Program, which requires small municipalities with separate sewer systems to secure an ILR40 permit (Phase II MS4 Permit) to oversee the release of stormwater into local waterways. Sewer permits must comply with the current edition of the Illinois Recommended Standards for Sewage Works, Standard Specifications for Water and Sewer Main Construction, local standards and specifications, and Design Criteria for Pressure Sewer Systems, 35 Ill. Adm. Code 374.

Within the Calumet Corridor, Calumet City, Dolton, and Robbins have active NPDES permits. No permit is required for Blue Island, Calumet Park, or Riverdale. NPDES permits require stormwater management programs with the inclusion of six “Minimum Control Measures” under the following categories:

1. Public Education and Outreach on Stormwater Impacts
2. Public Involvement/Participation
3. Illicit Discharge Detection and Elimination
4. Construction Site Stormwater Runoff Control
5. Post-Construction Stormwater Management in New Development and Redevelopment
6. Pollution Prevention/Good Housekeeping for Municipal Operations
REGIONAL REGULATIONS

Within Cook County, the MWRD Watershed Management Ordinance (WMO) applies to all developments and qualified sewer construction within its service area. The WMO regulates the following:

- **Qualified sewer construction.** Defined based on the project’s location, size, type, and ultimate sewer outlet location. Generally, any construction or modification of storm sewers in a combined sewer area and construction of storm sewers in a separate sewer area that discharge to a MWRD District facility are considered qualified sewer construction and require a Watershed Management Permit.

- **Drainage and detention and volume control.** The WMO includes several site development and stormwater management standards to restrict developments from increasing flood elevations, decreasing flood conveyance, or causing any increases in flood velocity within streams. The most significant requirements established to meet these goals include runoff volume control and storage requirements for developments. Figure RR-20 includes a summary of site stormwater management permit requirements.

- **Floodplain management, isolated wetland protection, and riparian environment protection.** Resource protection areas include floodplains, wetlands, wetland buffers, and riparian environments. The WMO requires that development in the floodplain cannot increase flood elevations or decrease conveyance capacity on other property.

- **Soil erosion and sediment control.** Erosion control includes measures to prevent soil from being removed from the earth’s surface - planting vegetation, mulching, hydro-mulching, and installing geotextile fabrics. Sediment control measures - silt fences, fiber rolls, sediment traps, and wattles - prevent the transport of soil once it has been removed. The WMO requires that erosion and sediment control practices be included in the initial site plan of a development.

As part of the WMO, the MWRD also implements an Infiltration and Inflow Control Program (ICAP2) with which all municipalities in the MWRD’s service area must comply. The program aims to limit the amount of infiltration and inflow (I&I) entering into sanitary sewer systems. Excessive I&I can overwhelm sanitary systems.

systems with stormwater. Since sanitary systems are designed to hold only sewage, not stormwater, they are easily overwhelmed by big storms, leading to sanitary sewer overflows and basement backups. ICAP2 requires communities within MWRD’s service area to identify and address I&I sources within public and private sewer systems. As of November 2015, Calumet City, Dolton, Riverdale, and Robbins all have completed and approved rehabilitations programs.

LOCAL CODES AND ORDINANCES

Local zoning, building codes, and ordinances can either promote or be a barrier to better stormwater management. For example, excessive requirements for on-site parking spaces promote unnecessary increases of impervious surfaces. Laws prohibiting flat roofs restrict green roof installations. Codes requiring that grass be trimmed to less than 10 inches high prevents the use of native grasses that could promote infiltration and improve local habitat.

Comprehensive plans, zoning codes, and building standards are just a few examples of regulations that intentionally or unintentionally regulate the way water is transported, collected and absorbed. Regulations that promote sprawling development or large amounts of impervious cover, for example, can impair stream water quality, worsen flooding, and reduce the recharge of aquifers. Local development codes should be reviewed to limit instances of these types of unintended consequences on local water management.

As is common in many communities, the municipalities in this area have adopted state, county, and international standards into their respective local ordinances. The International Building Code (IBC) developed by the International Code Council (ICC) sets out a series of codes relevant to all buildings except one- and two-family dwellings and is typically adopted in conjunction with the International Plumbing Code, International Mechanical Code, International Residential Code, International Property Maintenance Code, International Energy Conservation Code, etc. These codes are periodically updated, so it is important to note the year in which the adopted code was written. Blue Island is currently using the 2012 version, while Dolton is using 2009. Riverdale is operating under a similar, but different prescribed code from the Council of American Building Officials (CABO) One and Two Family Dwelling Code, 1995 edition, and Building Officials and Code Administrators (BOCA) National Building Code, 1996 edition.

Some notable additions to local ordinances in this area include Blue Island’s guidance on “Plant Materials” which suggests, “inclusion of native plant material wherever possible” and promotes “adaptability of proposed plant material to the particular microclimate (sun, shade, dry or wet soils and the like) in which it is to be located” (Blue Island, Illinois Code of Ordinances § 163.05). Blue Island also specifies the inclusion of landscaping in parking lots and “streetscapes” (Blue Island, Illinois Code of Ordinances § 163.08 and 163.09).
RAINREADY SOLUTIONS: GOALS, STRATEGIES, AND ACTIONS

A RainReady Future is Possible!

Communities around the country (and right next door in Midlothian) are realizing that real impact is possible when residents, municipal staff, elected representatives, and regional stakeholders work together towards a shared vision.

Reducing flooding is a key priority for residents and local governments alike throughout the Calumet Corridor and is the focus of this plan. However, reducing flooding is not the only priority. Creating new jobs, educational and recreational opportunities for youth, and a sense-of-place and local ownership also ranked highly amongst those we heard from in this RainReady planning process.

Good news.

There are practical steps that communities can take that will reduce their flooding risk AND support other community priorities.

Creating resilient and thriving communities, however, will require working together across boundaries and borders that are generally not crossed. Just as rain water flows across public and private property, different land uses, and different spatial scales, so to must the strategies and actions that communities implement to reduce flooding.

Creating resilient communities will require that residents, municipal staff, elected representatives, and regional experts work collaboratively in defining problems and designing, determining, implementing, and maintaining solutions. Building community resilience also requires that communities develop infrastructure projects and programs (and financing strategies) that cut across public and private lines.

Such projects and programs (and the partnerships necessary to bring them to fruition) should deliver multiple functions and benefits, be planned in a coordinated manner, foster sustainable and long-term economic development (as opposed to short-term economic growth), and improve the quality of life for all.

RainReady solutions are resilient solutions. The solutions put forth in this plan aim to reduce flooding in a way simultaneously strengthens homes, beautifies neighborhoods, improves transportation, revitalizes commercial areas, and restores natural areas.

These solutions are organized into goals, strategies, and actions.
The Three R’s:
Reorient, Repair, Retrofit

RainReady solutions encompass a wide range of policies, projects, programs, and partnerships that have a role to play in setting communities on a path towards resilience. The proposed solutions for each community take into account each community’s strengths, concerns, priorities, and goals, as well as infrastructure projects and programs that are already on-the-books or active on-the-ground.

To help readers of this plan navigate the various proposed policies, projects, programs, and partnerships and understand who is responsible for a given action, we packaged these RainReady solutions into an easy-to-digest concept: The Three R’s. Each ‘R’ represents a high-level goal that can guide communities along the paths towards resilience (see below).

Each goal has a corresponding set of strategies. Some of these strategies may look familiar, if you have been involved with other planning processes. This is intentional, as building on prior planning efforts and supporting existing community priorities through stormwater projects was an objective of this planning process from the outset.

Each strategy has a corresponding set of actions. These actions were identified through interviews with experts, the RainReady Technical Advisory Committee, and an extensive review of best practices in building community resilience.

In each community plan, these goals, strategies, and actions are tailored so that they fit each community’s unique vision for the future, strengths, concerns, and priorities.

This chapter will help readers understand the various goals, strategies, and actions that are proposed in the community action plans.
REORIENT STRATEGIES

• **Strategy 1.** Build capacity to make well-informed decisions and execute them

• **Strategy 2.** Plan and implement projects collaboratively

• **Strategy 3.** Promote smart, equitable, and resilient land development

• **Strategy 4.** Prepare your community for future shocks and stresses

REPAIR STRATEGIES

• **Strategy 1.** Document your municipal sewer and stormwater drainage system

• **Strategy 2.** Inspect and evaluate your municipal sewer and stormwater drainage system

• **Strategy 3.** Rehabilitate your municipal sewer and stormwater drainage system

• **Strategy 4.** Maintain your municipal sewer and stormwater drainage system

RETROFIT STRATEGIES

• **Strategy 1.** Retrofit your homes and neighborhoods

• **Strategy 2.** Retrofit your shopping areas, business districts, and downtown areas

• **Strategy 3.** Retrofit your industrial centers and railroad corridors

• **Strategy 4.** Retrofit (restore) your open space and natural areas
Visons, Goals, and Strategies, Oh My!

Several specific terms are used to describe the various components of this plan. The following definitions will help readers of this plan keep these terms and definitions straight:

**TERM: VISION STATEMENTS**

**DEFINITION:**
A vision statement articulates the collective understanding of the ideal future of a community. One vision statement was created for the Calumet Corridor area and each Steering Committee.

Visions statements were created by synthesizing the community input collected through the process and were iteratively refined with the community steering committees.

**EXAMPLE FROM PLAN:**
A RainReady Calumet City will be a community that works. It will be known a place where residents, city staff, and elected representatives work together and achieve real results. Through strategic and coordinated investments in green, grey, and green-grey infrastructure improvements, Calumet City’s aging infrastructure, crumbling alleys, vacant lots, and expansive parking lots will be transformed from liabilities into community assets.

**TERM: MISSION STATEMENTS**

**DEFINITION:**
A mission statement summarizes the big-picture goals and values of an organization. One mission statement was developed for each of the six Calumet Corridor Steering Committees.

Mission statements were drafted by community steering committees, refined by the ReadyReady team, and then accepted by the community steering committees.

**EXAMPLE FROM PLAN:**
The RainReady Calumet City Steering Committee will work with residents, staff and elected representatives, to make Calumet City resilient by way of green and grey infrastructure improvements in alleys, vacant lots and expansive parking lots.
**TERM: PRIORITY**

**DEFINITION:**
A priority is an idea or recommendation (project, program, policy change) that a community especially wants to see accomplished or enacted.

Priorities were identified by:
- Educating residents on existing flooding risks and resilience opportunities and
- Having the steering committee define which recommendations are most important.

**EXAMPLE FROM PLAN:**
Ensure that all municipal planting projects in municipality use native plant species.

---

**TERM: GOALS**

**DEFINITION:**
Goals articulate ideal outcomes in a RainReady community. The Three RainReady goals (i.e., Reorient, Repair, and Retrofit) goals were applied to each community.

The RainReady goals were developed through an assessment of the primary planning problem to be addressed (chronic urban flooding) as well as broader factors (i.e., structural roadblocks, capacity potholes).

**EXAMPLE FROM PLAN:**
- **Reorient** Calumet City so that the community is on a path towards resilience
- **Repair** Calumet City’s municipal sewer and stormwater drainage systems
- **Retrofit** the built landscapes throughout Calumet City with green, grey, and green-grey infrastructure improvements, and restore natural landscapes.
TERM: STRATEGIES

DEFINITION:
Strategies describe a way to achieve a RainReady goal.

A broad suite of potential strategies was developed through reviewing previous plans, inventorying best practices and case studies, and working collaboratively with community residents, staff, and elected representatives. Strategies were applied to communities based on each community’s unique risks and resilience opportunities.

EXAMPLE FROM PLAN:
Strategy 1. Implement a residential resilience program.

TERM: ACTIONS

DEFINITION:
Recommended actions are specific projects, programs, policies, and partnerships that comprise a strategy.

Specific actions (e.g., what is proposed, where it goes, who leads, when does it happen, etc.) were developed by synthesizing outputs from analytical flood and solution mapping tools with input gathered through a collaborative and iterative community engagement process.

EXAMPLE FROM PLAN:
Adopt/Accept the RainReady Calumet City Action Plan; update the plan every 2-5 years; incorporate the plan’s recommendations into forthcoming capital improvement planning efforts and decision-making efforts.
The following goals are intended to help guide communities along the path towards greater resilience.

CNT/RainReady does not claim to have an exact blueprint for building a resilient community. In fact, this is something that each community needs to envision (and continually re-envision) for itself. CNT/RainReady, however, does have almost 40 years of experience in helping communities envision a more sustainable and equitable future and equipping people with the tools, insights, and know-how with which to realize that future.

Community leaders should acknowledge that the future is uncertain and develop the capacity of their communities (e.g., individuals, families, governments, infrastructure systems) to continually learn, improve, and adapt to change. The Three R’s, therefore, are not a rigid step-by-step set of instructions, but rather a set of recommendations to guide how communities (re)orient towards a resilient future, repair and maintain existing infrastructure, and retrofit the natural and built landscapes.

**RAINREADY GOALS:**

- **Reorient communities.** Put communities on a path towards greater resilience by reorienting day-to-day operations and long-term planning.

- **Repair existing infrastructure.** Establish modernized infrastructure systems that allow communities to survive and thrive no matter what shocks and stresses they face.

- **Retrofit the landscape.** Create beautiful communities by converting impervious surfaces into natural landscapes, installing new green, grey, and green-grey infrastructure, and restoring natural areas.

**Reality Check**

The path towards resilience is inherently uncertain (see The Path Forward). Communities will never know—with 100% certainty—what shocks and stresses lay ahead and what roadblocks and potholes may arise in the future. Consequently, there is no “one best way” to build your community’s resilience. Each community has a unique set of challenges and opportunities that they must navigate. This does not mean, however, that communities cannot take strategic and intentional steps to thrive today and prepare for tomorrow.
Strong communities are made up of strong and resilient homes. Reducing your individual flooding risk starts at home. Whether you are suffering from two feet of water in your basement or a constantly soggy lawn, there are simple, well-tested solutions available to homeowners and renters such as: regrading yards, televising and cleaning lateral lines, diverting water from gutters away from a house or into a rain gardens, and the careful placement or relocation of fences, garden, sheds, or anything that can block stormwater.

Some flooding and stormwater issues need to be addressed at the community-wide scale. For example, restoring a stream segment that flows through town, improving streetscapes, large sewer projects, revitalizing commercial corridors, and de-paving large impervious areas all require the marshalling of economic resources and political capital at the community level.

The communities of the Calumet Corridor are part of a broader region (see Regional Context). Waterways traverse the region and stormwater flows across municipal lines with no regard for political jurisdictions. Therefore, implementing large-scale projects like restoring a stream that crosses through multiple towns, constructing a regional trail, and developing a regional stormwater detention facilities, will require planning and implementation efforts at the regional level.
This plan also outlines actions that apply to different areas within your community. These different areas, or “land uses,” include the places where you live, work, play, and travel. To keep it simple, we organized the various land uses present throughout the Calumet Corridor into four primary categories:

**YOUR HOMES AND NEIGHBORHOODS**

The Calumet Corridor boasts many historic neighborhoods, each of which have their own unique character. Many of these neighborhoods, however, are in need of stabilization and restoration. This plan includes a variety of strategies and actions aimed at strengthening existing homes, beautifying the residential right-of-way (e.g., streets, parkways, sidewalks, alleys), and bringing new life to underutilized and vacant parcels.

**YOUR INDUSTRIAL CENTERS AND TRANSPORTATION CORRIDORS**

The large industrial areas, railroads, and highways that traverse the Calumet Corridor have supported previous eras of economic growth and will have a key role to play in the resilient revitalization of the broader Calumet Region. Although these legacy assets may present some challenges to residents of the Calumet Corridor (e.g., congestion due to automobiles and freight trains, air pollutions, brownfields), they can be redeveloped and revitalized in a way that reduces flooding in surrounding neighborhoods and promotes sustainable economic development.

**YOUR SHOPPING AREAS AND BUSINESS DISTRICTS**

Just as there are historic residential neighborhoods in need of repair, there are also historic (and newer) commercial corridors that—with just a bit of help—can once again be charming and pleasant places to shop and work (as opposed to traffic-ridden and stressful places that raise your blood pressure). This plan includes a variety of strategies and actions aimed at strengthening existing businesses, attracting new businesses, improving the commercial right-of-way (e.g., streets, parkways, sidewalks, alleys), and bringing new life to underutilized and vacant parcels.

**YOUR OPEN SPACE AND NATURAL AREA**

The natural land and water resources of the Calumet region (e.g., freshwater, rivers and streams, forest, prairies, wetlands) gave rise to the communities that occupy the landscape today. Sadly, only small remnants remain of these pre-settlement habitats and communities. Restoring these natural assets and re-connecting people to them—both physically and metaphorically—will be critical to creating a more resilient Calumet Corridor.
Goal 1: Reorient

REORIENT COMMUNITIES

PUT COMMUNITIES ON A PATH TOWARDS RESILIENCE BY REORIENTING DAY TO DAY OPERATIONS AND LONG-TERM PLANNING.

This goal will be achieved through strategic actions to improve local decision-making, ensure collaborative planning, promote equitable and resilient development, and prepare communities for future storms.

REORIENT STRATEGIES

- **Strategy 1. Build capacity to make well-informed decisions and execute them.** Adopt a long-term, adaptive, and integrated approach to managing day-to-day municipal operations, engaging in planning efforts, and making investment and development decisions.

- **Strategy 2. Plan and implement projects collaboratively.** Ensure that ongoing planning and decision-making processes are transparent, well-coordinated, and broadly participatory.

- **Strategy 3. Promote smart, equitable, and resilient land development.** Incentivize smart, equitable, and more resilient land development at all levels—from the home to the region.

- **Strategy 4. Prepare your community for future shocks and stresses.** Equip your residents, businesses, municipal staff, elected representatives, and regional partners with the knowledge and resources they need to prepare for, mitigate, respond to, and recover (stronger) from future storms—both large and small.

REORIENT ACTIONS

- **Strategy 1. Build capacity to make good decisions**
  - Build trust with your peers, your staff, and your constituents
  - Monitor and evaluate the performance of projects and programs
  - Improve the flow of information between departments and with your constituents
  - Cultivate a culture where it is okay to experiment, make mistakes, and learn
  - Continually seek to improve
**Strategy 2. Plan and implement projects collaboratively**
- Engage a diversity of stakeholders early and often
- Listen, listen, and then listen some more
- Design outreach activities so that they match with the schedules, priorities, and expertise of the stakeholder group(s) you are seeking to engage
- Accomplish and celebrate the small victories (they add up)
- Don’t take it personally
- Work together and recruit your neighbors
- See out creative ways to implement projects

**Strategy 3. Promote smart, equitable, and resilient land development**
- Conduct a local ordinance audit
- Update building codes, zoning, and ordinances
- Public and Private Space Retrofit Programs
- Green Infrastructure and Flood Management Training

**Strategy 4. Prepare your community**
- Know your risk: review the RainReady Plan: Calumet Corridor and Cook County’s Hazard Mitigation Plan and implement their recommendations
- Agree on the path forward: work with RainReady and others to identify priorities for preparedness; and develop an emergency response plan
- Develop and implement an emergency alert system that alerts residents and visitors of an impending flood and other hazards or threats
- Educate the community on flood preparedness through school programs and other public forums (e.g., workshops, newsletters, websites, social media)
- Partner with American Red Cross, FEMA, and other organizations to provide disaster preparedness training
- Organize trainees into Community Emergency Response Teams (CERT)
- Educate homeowners, renters, and businesses about steps to reduce flood risk in homes and businesses and how to choose the right insurance so that they can quickly clean up, repair qualified damages, and strengthen the community following a storm
- Use tools like the Flood Vulnerability Assessment for Critical Facilities to assess the vulnerability of critical facilities and plan accordingly
Goal 2: Repair

Repair Existing Infrastructure

Establish modernized infrastructure systems that allow communities to survive and thrive no matter what shocks and stresses they face.

Bringing aging and limited sewer systems up to a state of good repair will take strategic and ongoing efforts to document, inspect, maintain, and rehabilitate your existing sewer systems and residential lateral lines.

Repair Strategies

- **Strategy 1. Document your municipal sewer and stormwater drainage system.** Gather information about the location, age, and extent of community infrastructure assets. Develop a system to record information about the various components of your overall system.

- **Strategy 2. Inspect and evaluate your municipal sewer and stormwater drainage system.** Regularly inspect your system so you know its condition and can identify problem areas.

- **Strategy 3. Rehabilitate your municipal sewer and stormwater drainage system.** When necessary, rehabilitate parts of the system to bring them up to a state of good repair.

- **Strategy 4. Maintain your municipal and sewer and stormwater drainage system.** Regularly clean and maintain your sewer system to keep small problems from turning into big ones.

Repair Actions

- **Strategy 1. Document your municipal sewer system**
  - Update your sewer atlas information
  - Create a system (e.g., a Geographic Information System) for managing information on your municipal sewer system
  - Share your updated sewer atlas information through the Southland Suburban Mayor’s and Managers Association (SSMMA) to enable cross-jurisdictional stormwater planning

- **Strategy 2. Inspect your municipal sewer system**
  - Create a sewer inspection plan and schedule
  - Continually inspect your municipal sewer system on a cyclical basis (e.g., using both visual and closed circuit television inspection techniques)
  - Sewer televizing and lining (inspection and maintenance task)

- **Strategy 3. Maintain your municipal sewer system**
  - Create a maintenance plan for green and grey infrastructure
  - Catch basin cleaning
  - Crack sealing
  - Sewer televizing and lining (inspection and maintenance task)
  - Clean sewers and manholes
  - Street sweeping

- **Strategy 4. Rehabilitate your municipal sewer system**
  - Sewer point repairs
  - Roadway resurfacing (which improves gutters and other stormwater infrastructure)
Goal 3: Retrofit

RETROFIT THE LANDSCAPE

CREATE BEAUTIFUL, RAINREADY COMMUNITIES BY CONVERTING IMPERVIOUS SURFACES INTO NATURAL LANDSCAPES AND INSTALLING NEW GREEN AND GREY INFRASTRUCTURE.

Bringing aging and limited sewer systems up to a state of good repair will take strategic and ongoing efforts to document, inspect, maintain, and rehabilitate your existing sewer systems and residential lateral lines.

RETROFIT STRATEGIES

• Strategy 1. Retrofit your homes and neighborhoods. Retrofit homes and neighborhoods in a way that meets basic housing needs, supports public health, and creates more vibrant, connected, and livable places.

• Strategy 2. Retrofit your shopping areas, business districts, and downtown areas. Retrofit shopping areas, business districts, and downtown areas in a way that fosters economic prosperity, supports livelihoods and employment, and creates more walkable and attractive places.

• Strategy 3. Retrofit your industrial centers and railroad corridors. Retrofit industrial centers and railroad corridors in a way that creates new jobs, beautifies neighborhoods, and provides reliable transportation options.

• Strategy 4. Retrofit (restore) your open space and natural areas. Retrofit and restore your open space and natural areas in a way that preserves, protects, and enhances land and water resources, and connects these natural assets to your community.

RETROFIT ACTIONS

• Strategy 1. Retrofit your homes and neighborhoods
  • Implement a residential resilience program
  • Bring new life to vacant residential land
  • Create green schoolyards and churches
  • Create a network of residential green streets and complete streets
  • Create green alleys

• Strategy 2. Retrofit your shopping areas, business districts, and downtown areas
  • Enhance public facilities (e.g., schools and government buildings)
  • Bring new life to vacant and underutilized commercial land
  • Bring new life to underutilized parking lots
  • Create a network of commercial green streets and complete streets

• Strategy 3. Retrofit your industrial centers and railroad corridors
  • Improve the edges of large industrial sites and railroad corridors
  • Create a network of industrial green streets
  • Redevelop industrial sites in a way that reduces nearby flooding

• Strategy 4. Retrofit (restore) your open land and natural areas
  • Expand existing and create new open space and outdoor recreation amenities
  • Expand existing and create new urban agriculture sites
  • Integrate green infrastructure in municipal park systems
RainReady
Calumet Corridor
Plan for Calumet City, IL
A RainReady Calumet City would be a community where all residents and businesses benefit from flood relief in a way that also brings neighborhood beautification, retail activity, new jobs, recreation, and habitat conservation. In this community, public investment is transparent and fair.

In order to better understand Calumet City’s flood risk, the Center for Neighborhood Technology (CNT), the U.S. Army Corps of Engineers, the RainReady Calumet City Steering Committee, and Calumet City joined together in February 2016. Throughout the year, this group met regularly, hosted community meetings, went door-to-door in the neighborhoods, held seven educational workshops, held five Steering Committee meetings, and reviewed over 100 plans and studies. 104 Calumet City residents filled out our flooding survey.

Together, we have established a shared vision and path toward a flood-resilient Calumet City: The RainReady Calumet City Plan. This Citizen’s Guide to a RainReady Calumet City covers the highlights of the plan, for more information visit www.rainready.org/calumet-corridor.

A Path Forward

Calumet City has been proactive in developing a robust sewer maintenance plan and setting up a cost-share program to assist homeowners who experience flooding. The path forward for the community includes building on the community’s strengths as well as coordinating investments in sewer maintenance and new green and grey capital infrastructure projects that protect public and private property.

Equipped with the RainReady Plan, the City now has a roadmap to reduce flooding in a way that strengthens neighborhoods and businesses, and brings new life to vacant areas of town. With modern and well-maintained infrastructure, the City will be prepared to weather future storms—both large and small.

KEEP READING FOR MORE INFORMATION ON THE PATH AHEAD FOR CALUMET CITY!
Understanding the Problem

Like many of its neighbors, Calumet City has long been plagued by chronic flooding. In recent years, the scope and severity of the floods have become significantly worse. A combination of aging and limited infrastructure and changes in regional climate have left many Calumet City residents and infrastructure systems vulnerable to flooding. From 2007 to 2011, 4,620 flood-related insurance claims were filed, with more than $12,603,844 dollars paid out in damages (CNT, 2014). Residents suffer a mix of basement backup, street and yard flooding, overbanking from the Little Calumet River, and foundation seepage. In 2015, the broader Calumet Corridor in which Calumet City is located was identified by Cook County as the area that was “most impacted and distressed” by the April 2013 storms (DR-4116). Strategic policy changes and coordinated investment in green and grey infrastructure capital projects and ongoing maintenance will be part of the mix of solutions necessary to mitigate chronic flooding issues and large storms.

RainReady Calumet City Survey Results

Respondents experiencing flooding problems:

- Yes: 92%
- No: 8%

104 survey respondents

$4,291 is the average amount spent on stormwater-related repairs

$1,526 residents are willing to invest to reduce risk of future damage

How does water enter properties?

- 34% Backing up through drains
- 51% Seeping through walls
- 16% Flowing through doors/windows
- 26% Standing/pooling in yard
- 16% Overflow from street, creek, nearby body of water
- 7% Other
- 3% Don’t know

What is the level of worry about flooding’s impact on property value?

- Extremely worried: 37%
- Very worried: 15%
- Moderately worried: 20%
- Slightly worried: 19%
- Not at all worried: 9%

How much do heavy rains impact quality of life?

- A great deal: 29%
- A lot: 18%
- A moderate amount: 34%
- A little: 18%
- Not at all: 11%

How much do heavy rains impact commute or other travel?

- A great deal: 10%
- A lot: 6%
- A moderate amount: 31%
- A little: 32%
- Not at all: 22%

What is the preparedness of the community to work together to find a solution?

- Extremely prepared: 6%
- Very prepared: 9%
- Moderately prepared: 24%
- Slightly prepared: 24%
- Not at all prepared: 37%

How effective will local government officials be in addressing flooding issues?

- Extremely well: 8%
- Very well: 4%
- Moderately well: 24%
- Slightly well: 19%
- Not at all well: 45%

Data Source: CNT Survey, 2015

*Respondents who answered “Yes, I experience problems” and “Do not experience problems anymore” were grouped into the “Yes” category because local officials expect residents to experience ongoing flooding problems or have experienced problems in the past respectively.
Planning the Solutions

The path ahead for Calumet City requires coordinated action at multiple scales. Fortunately, community residents, municipal staff, and elected representatives are aligned in their desire for a more beautiful, flood-resilient community. The RainReady Plan recommends the following priority projects from a comprehensive list of recommendations:

**RETROFITTING PARKING Lots**

Calumet City has many large parking lots. When a big storm hits the city, rainwater runs off these parking lots in sheets, often overwhelming the local sewer and sending pollutants into local waterways. While access to safe and convenient parking is necessary to support Calumet City’s commercial corridors, many of these lots sit vacant most of the time. Fortunately, it is possible to retrofit parking lots in a way that creates a safer and more inviting pedestrian environment, increases economic activity, and mitigates local flooding issues.

**NEIGHBORHOOD GREENING**

Create a network of beautiful residential streets built to capture stormwater, increase property values, and make streets safer for walking, biking, and playing. This program would help community members soak up rain by installing green infrastructure in their yard, parkways, parks, and vacant properties in the neighborhood. RainReady recommends concentrating efforts in the neighborhoods south of Pulaski Road between Burnham Avenue and State Line Road where there is a large concentration of vacant parcels.

**INVEST IN THE NEW TOWN CENTER**

Calumet City is already working to bring fresh energy to its Town Center. RainReady recommends that these improvements incorporate strategies to reduce flooding while creating beautiful public spaces. This could include community gardens, improvements to Memorial Park, bike lanes adjacent to bioswales, and rain gardens at existing and proposed government buildings.
Quick Steps

We know that residents experience flooding every summer, and the need for help is urgent. Here are 7 solutions that homeowners should consider to reduce their risk today:

• **ASSESS YOUR PROPERTY.**
  The first step to solving your flood problem is to understand how water falls on your property and flows through your pipes. If you have significant problems, you may need the help of an engineer, plumber, electrician, or landscape designer.

• **MAKE YARD IMPROVEMENTS.**
  In order to reduce flooding, capture stormwater runoff using rain gardens, swales, dry wells, permeable paving, rain barrels, or cisterns.

• **ELEVATE YOUR APPLIANCES.**
  If water regularly enters your home, place appliances, furnaces, hot water heaters, and electrical panels above the typical flood level on wood or concrete blocks.

• **HAVE YOUR BUILDING SEWERS CHECKED.**
  Faulty pipes connecting your home to the municipal sewer system can exacerbate foundation damage and flooding in your home. Ensure that grease, waste, or tree roots are not obstructing the pipe and preventing wastewater from leaving the house.

• **RECLAIM YOUR PARKWAY.**
  The strips between sidewalks and streets can be transformed into attractive green spaces that absorb stormwater runoff, reduce municipal maintenance costs, and beautify streets. Be sure to check your municipal code for which plants are permitted.

• **GET INSURED.**
  There are several options available to protect you against the risk of water damage, including home insurance policies, flood insurance riders, and the National Flood Insurance Program (NFIP), established by FEMA and administered by your local insurance companies.

• **ADVOCATE FOR THE RAINREADY PLAN.**
  This plan outlines solutions to community wide flooding. Get involved in your local Steering Committee to make sure the plan is implemented!

---

GET INVOLVED!

Community leaders joined together in 2016 to form the RainReady Calumet City Steering Committee. The Committee is particularly focused on retrofitting vacant lots, alleys, and vast concrete districts with green infrastructure. They also seek to expand social and youth activities. Join in!

The RainReady Calumet City Steering Committee meets monthly! For more information contact Rebecca Raines at rraines@cnt.org or 773.269.2217.
Calumet City is adjacent to Chicago and shares its eastern border with the Indiana state line. The City consists of 7.31 square miles of land, with the Calumet River flowing through the City’s northern edge. Calumet City is bordered by Burnham and Chicago to the north, Hammond, Indiana to the east, Lansing to the south, and Dolton and South Holland to the west. The City lies along Interstate 94 (Bishop Ford Freeway) and is in close proximity to Interstate 80 (Kingery Expressway). These two major expressways provide access to the entire region, and in the case of Interstate 80, the entire nation.

In the 123 years since incorporation, Calumet City has been a hub to meatpackers, beer brewers, printmakers, and famed bootlegger Al Capone. These days, River Oaks Center draws shoppers from across the south suburbs, the improved Public Library and Police Department set a standard for public excellence, and Calumet City public schools empower young people to be leaders in the community. The City still conducts business from its original, brick-laid City Hall building.

As in many other neighboring communities, however, residents and businesses of Calumet City experience severe and chronic flooding. From 2007 to 2011, 4,620 flood-related insurance claims were filed, with more than $12,603,844 dollars paid out in damages (CNT, 2014). Flooding in Calumet City exacerbates existing challenges, such as maintaining older homes, economic divestment, and aging public infrastructure. On the other hand, efforts to mitigate Calumet City’s flooding challenges can also support the community’s broader economic and community development goals.
Calumet City, IL

**AT A GLANCE**

- **Racial Composition**
  - 70.5% Black or African American
  - 23.8% White
  - 2.8% Some Other Race
  - 2.3% Two or More Races
  - 0.5% Asian, American Indian and Alaska Native

- **Total Population**: 37,197

- **Total Number of Households**: 16,233

- **86% of residents hold high school diploma**

- **16% of residents hold college diploma**

- **Median Age**: 35

- **22% people below poverty level**

- **Median Per Capita Income**: $20,066

- **Median Household Income**: $39,530

Data Source: US Census
Flooding Risks and Resilience Opportunities

Residents and business owners in Calumet City experience several types of flooding:

- **Basement backup** from the local sewer system and damaged private lateral lines, impacting several parts of town
- **Street and yard flooding** which occurs when local drainage systems are overwhelmed with stormwater and sewage causing water to pool
- **Foundation seepage** in several areas of Calumet City, causing rot and mold in basement walls
- **Riverine flooding** from the Little Calumet River, which has devastated parts of the City that are along its banks in the past

Areas with higher flooding risk are shown in Figure CC-7. Proposed flooding solutions are also shown on this map. These “green-grey” solutions were identified through a community-driven and analytically-rigorous process. The result is a plan that works, both in terms of its community support and physical and economic feasibility.
Key findings from this Flooding Risk and Resilience Opportunity assessment are presented here. This risk and opportunity assessment provided the foundation for the strategies and recommendations presented in the RainReady Action Plan for Calumet City.

Four main factors contribute to flooding in Calumet City:

**INCREASING IMPERVIOUS SURFACES**

As Calumet City developed over time, natural lands were converted to buildings, parking lots, streets, and other “impervious surfaces.” The increase in impervious surfaces resulted in fewer open areas for stormwater to sink into the ground. As Calumet City takes steps to redevelop certain commercial and industrial areas (e.g., the New Town Center Area, commercial corridors along Sibley Boulevard, Torrence Avenue, Burnham Avenue, River Oaks Drive, and River Oaks Mall), efforts should be made to manage additional stormwater runoff from new developments as well as reduce runoff from existing impervious surfaces.

**AGING AND LIMITED SEWER INFRASTRUCTURE**

MWRD’s TARP interceptors run along the western and eastern sections of Calumet City to alleviate backups in the combined sewer network. The southern portion of the network connects near Burnham Avenue and 163rd Street. In the north, the network connects near Burnham Avenue and State Street. Calumet City has one of the most robust storm sewer networks in the region. However, the relative flatness of the landscape is exacerbated by some unique drainage issues. In many areas, the curbs are very low, which causes stormwater to pond on residential lawns, which may contribute to basement seepage. These lawns are ideal locations to install green infrastructure for stormwater management. The age of the sewer may also play a role; as sewer systems age, pipes may collapse...
causing local drainage issues. Calumet City should continue to document, inspect, maintain, and repair their municipal sewer system so as to bring it up to a state of good repair.

**MORE SEVERE STORMS**

Climate change is bringing more frequent, high-intensity storms to the region. In light of this, Calumet City should not only prepare for storms like the one that occurred in April 2013, but also much larger and more frequent storms, and more variable weather (e.g., intense storms followed by long droughts, more freeze/thaw cycles). This will mean inspecting and potentially improving its levee system. Residents, municipal staff, and elected officials should be equipped with the knowledge and resources needed to prepare for, mitigate, and recover from future storms—both large and small.

**FLAT TOPOGRAPHY**

Since stormwater is largely directed via gravity, Calumet City’s generally flat topography creates challenges for moving the water out of neighborhoods. A subtle glacial ridge travels southeast along Michigan City Road, splitting the community into two separate drainage networks. In the north, stormwater makes its way to Burnham, just north of where State Street bends to parallel rail lines. Stormwater continues at a slow downward slope to an outfall into the Grand Calumet River. In the south, stormwater mostly drains directly into the Little Calumet River.
These overland flow path and depression area maps show where stormwater is likely to flow and accumulate, or pool, in Calumet City. These maps are based on high-resolution digital elevation models (DEMs) derived from Light Detection and Ranging (LiDAR) technology.

Although LiDAR provides very detailed information on land cover and topography, there are several factors that may result in discrepancies between these maps and how stormwater actually flows through a community (e.g., small landscape features like gutters, curbs, small hills that route water, which may not have been picked up in our flow path analysis). Also, each community has a sewer and drainage system that is designed to intercept and manage stormwater. Our team modelled the flow of stormwater over the landscape as if local sewer systems are at full capacity and could not handle any additional flows. In other words these maps only show the overland flow paths and accumulation of stormwater and do not factor in the underlying sewer network.

In spite of these limitations and assumptions, these maps represent a good approximation of how stormwater is likely to flow and accumulate in the Calumet Corridor. These maps were used alongside other information on flooding risk and solution opportunities to determine where green infrastructure retrofits could alleviate local flooding issues. This information informed each community’s action plan.
The following section summarizes what we heard from Calumet City residents, municipal staff, and elected representatives through the RainReady planning process as well as what we gathered from previous plans completed for the City (see Figure CC-5). To make this information easier to digest, we organized it into community strengths, concerns, and land-based opportunities (i.e., planning priorities and capital projects) that apply to: 1) your homes and neighborhoods; 2) your business districts and shopping centers; 3) your industrial centers and railroad corridors; and 4) your open space and natural areas. We also created a community asset map to prompt ideas about how Calumet City’s RainReady Action Plan can strengthen and build on existing community assets.
RainReady Calumet City
COMMUNITY SURVEY

Respondents experiencing flooding problems

- 92% Yes
- 8% No

104 survey respondents

$4,291 is the average amount spent on stormwater-related repairs

$1,526 is the average amount residents are willing to invest to reduce risk of future damage

How does water enter properties?

- 34 Backing up through drains
- 51 Seeping through walls
- 16 Flowing through doors/windows
- 26 Pooling/ponding in yard
- 16 Overflow from street, creek, nearby body of water
- 7 Other
- 3 Don't know

What is the level of worry about flooding's impact on property value?

- Extremely worried: 37%
- Very worried: 15%
- Moderately worried: 20%
- Slightly worried: 19%
- Not at all worried: 9%
How much do heavy rains impact quality of life?

- 29% A great deal
- 18% A lot
- 34% A moderate amount
- 18% A little
- 11% Not at all

How much do heavy rains impact commute or other travel?

- A great deal 10%
- A lot 6%
- A moderate amount 31%
- A little 32%
- Not at all 22%

What is the preparedness of the community to work together to find a solution?

- Extremely prepared 6%
- Very prepared 9%
- Moderately prepared 24%
- Slightly prepared 24%
- Not at all prepared 37%

How effective will local government officials be in addressing flooding issues?

- Extremely well 8%
- Very well 4%
- Moderately well 24%
- Slightly well 19%
- Not at all well 45%

Data Source: CNT Survey, 2016
COMMUNITY STRENGTHS

- Calumet City Public Library
- The local newsletter
- Some residents are very involved with maintaining their yards and even the public right-of-way
- Resident population is relatively young and diverse
- See Community Asset Map (Figure CC-6)

COMMUNITY CONCERNS

- Flooding!
- The two-way communication between the City and residents can be improved
- Poor alley conditions (gravel has been gradually applied to alleys, but without proper grading)
- Calumet City would like to increase homeownership
- See Urban Flooding Risk Assessment (Figure CC-4)

LAND-BASED OPPORTUNITIES (PLANNING PRIORITIES AND CAPITAL PROJECTS)

Previous plans have called for:

- Improving and maintaining Calumet City’s sewer and drainage infrastructure (e.g., removing settlement from the Yates detention basin, separating the existing combined storm/sewer system, lining and televising sewers, maintaining and improving the levee, enhancing the Superior Avenue and State Line Detention Basins)
- Pursuing a public-private partnership to redevelop the open area corridor near Pulaski at State Street for a residential use
- Implementing innovative redevelopment projects (possibly in partnership with the SSMMA and SSLBA) at City-owned vacant lots where housing has been torn down.
- Revitalizing the area roughly located east of Freeland Avenue, south of Sibley Avenue, west of State Line Road, and north of 155th Place as Calumet City’s new Town Center. Calumet City lacks a strong identity and is usually only associated with the River Oaks Mall. While the mall is a great asset, the City would like to have a walkable and safe environment where its citizens can gather and others from out of town will want to visit. The mall is an auto-centric
environment where businesses may come and go. The concept for the Town Center is to create a long lasting and sustainable identity for the City. The vacant parcels and proximity to nearby amenities such as Memorial Park, makes this area a great location to create a City identity. With a limited demand for retail, due to the economy and low traffic counts, this area will not be considered a traditional downtown. While discussing the area with local residents, some of the main reasons this area is not visited often is due to the high crime and lack of activity. With downtown Hammond nearby, many residents cross the border for goods and services, in particularly the Strack and Van Til Grocery Store.

- Initiate a capital improvement program to fund a new police station and locating that a new station near the existing City Hall where a strong police presence could reduce the crime in the area.
- Continuing to upgrade the Calumet City Public Library’s facilities as the City grows and new technologies become available
- Turning some the vacant lots scattered throughout the community into community gardens that to grow local food and provide a gathering spot for the neighborhood. The City should work with local restaurants to allow them to grow fresh food in the garden to use for their business. This will help strengthen ties between the City and local businesses while also providing the public with fresh food. It is also advisable for the City to work with organizations which have a good reputation for establishing community gardens.
- Creating a community garden in Calumet City’s Town Center area
- Implementing a variety of measures (signs, educational brochures, one-on-one talks with City staff during inspections) to advise property owners of their drainage maintenance responsibilities
- Install green infrastructure BMPs in the “Frogtown” neighborhood to mitigate flooding

Here are some ideas that emerged through the RainReady planning process:

- Development of the Pulaski Road Corridor from Torrence to State to link key sites (high school, police, library, city hall) with attractive streetscape, open space amenities and façade improvements to create a “sense of place”
- Develop the multiple lots controlled by the City where housing has been torn down through private-public partnerships, specifically in the neighborhood southwest of City Hall
- Encourage improvement to residential properties and buildings by updated local ordinances and building codes, a façade improvement program, and a residential cost-share program
COMMUNITY STRENGTHS

• River Oaks Mall

• Torrence Avenue as the retail base of Calumet City—aside from River Oaks Mall—with anchors such as CVS and Walgreens plus high traffic counts

• Calumet City is a relatively attractive market for office space development

• Excellent regional location

• Business-friendly environment

• Affordable housing

COMMUNITY CONCERNS

• There is a desire to improve Calumet City’s regional identify

• Underutilized commercial/retail corridors

• River Oaks Mall is a car-centric environment, that is not inviting for pedestrians

• There are many large parking lots throughout Calumet City that sit vacant most of the time

• Flooding in streets and parking lots

• High crime rates

LAND-BASED OPPORTUNITIES (PLANNING PRIORITIES AND CAPITAL PROJECTS)

Previous plans have called for:

• Adopting flexible and adaptive zoning policies to address changing market conditions

• Pursuing mixed use development opportunities along major corridors, near River Oaks Center, and in the Town Center area

• Linking key sites (high school, police, library, city hall) along the Pulaski Road Corridor from Torrence to State with an attractive streetscape, open space amenities and façade improvements that create a “sense of place”

• Pursuing infill redevelopment projects (that include streetscape improvements and a façade improvement program) along the Torrence Avenue and Sibley Avenue commercial corridors

• Developing additional “outlots” around the River Oaks Mall (similar to what has been done at Chicago Ridge Mall), including unused parking areas around the mall on all sides. Properties with frontage along Torrence or River Oaks Drive are best suited for retail/restaurant or office uses, while properties along Ring Road are suggested for mixed use including offices and high density housing. The City has explored the potential for a casino in this area. Such entertainment uses would also be appropriate. While it is recognized that many of these lots along Torrence Avenue and 159th Street will be needed for parking, some additional outlot development will add to the vibrancy of the area. One or more of these outlots could also be used for stormwater management if needed.

• Enhancing the streetscape appearance along Torrence Avenue, including a new gateway treatment from the Little
Calumet River Bridge to Ring Road, a potential landscaped median, and enhanced landscape treatments on private property throughout the corridor. Coordination with Lansing to the south is recommended along Torrence Avenue to create a consistent streetscape concept for the corridor.

- Creating better accommodations for bicyclists, including bike lanes along Ring Road and multi-use paths leading into this major shopping/dining area along River Oaks Drive/159th Street and north along Torrence Avenue through the Forest Preserve property.

- Developing a unique and identifiable community gateway between the Bishop Ford Freeway and Madison Street. Focusing Sibley Boulevard streetscape enhancements on improving the appearance of this corridor as an entryway into the City and on making the area friendlier to pedestrians.

- Enhancing pedestrian and bicycle movement through the Pulaski Road corridor and visually connecting the area through common light standards and banners.

- Adopting and implementing a complete streets ordinance. Some key locations where complete streets concepts should be initially implemented are along all of Wentworth Avenue, Michigan City Road, Torrence Avenue, River Oaks Drive, and along Pulaski Road in between Michigan City Road and Burnham Avenue. When funding for maintenance for these main corridors becomes available, the City should look into incorporating complete street concepts. The Chicago Department of Transportation has recently passed a Complete Streets guideline to help with development within the City and should be used as a reference when considering complete street development (www.chicagocompletestreets.org).

- Implementing variety of measures (signs, educational brochures, one-on-one talks with City staff during inspections) to advise property owners of their drainage maintenance responsibilities and ways to mitigate their flooding risk.

Here are some ideas that were uncovered through the RainReady planning process:

- The River Oaks Drive Roadway Improvements were just approved by the Illinois Department of Transportation (IDOT) and is scheduled for Letting in March of 2017. The project will include traffic signal modification for a pedestrian crossing at River Oaks Drive East Mall Entrance as well as drainage improvements along the north side of River Oaks Drive from Torrence Avenue to River Road to alleviate standing water on the roadway.

- Local leaders anticipate adopting a local Complete Streets Policy in 2017.

- Pursue mixed use development opportunities along major corridors, near River Oaks, and in the New Town Center.

- Redevelop/Repurpose Calumet City’s small commercial buildings for small offices, light manufacturing, or other adaptive reuse.

- Implement a large-scale green infrastructure improvement project along the southern outer parking area at the River Oaks Mall (e.g., de-pave it and create a restored wetland that improves water quality, manages overbank flooding, and reduces runoff into the Little Calumet River). Connect this new “River Oaks Nature Preserve” to new mixed used developments along the northern and western edges of the River Oaks Mall’s “outlots.”

- Integrate green infrastructure BMPs and façade improvements into mixed-use development projects in the Wentworth Woods Corridor, River Oaks Corridor, Torrence Avenue Corridor, Sibley Boulevard Corridor, and Pulaski Road Corridor in order to revitalize these shopping districts, create a more walkable and inviting pedestrian environment, and expand housing options for families and young professionals.

- The City-owned vacant land along Sibley Boulevard between Torrence Avenue and Burnham Avenue is well-suited for mixed use residential development (a proposed development with a developer was unsuccessful some years ago but it would be good to revisit this opportunity through developer outreach). The development should incorporate green infrastructure improvements that not only manage the runoff from any new impervious areas, but also reduces flooding in downstream neighborhoods (to the north) and creates a greenway connection to the nearby Burnham Greenway (to the east).
COMMUNITY STRENGTHS

• Easy access via the interstate highway network including the Bishop Ford Expressway
• Recognized hub for industry and commerce
• Positive economic influence for the South Suburbs
• See Community Asset Map (Figure CC-6)

COMMUNITY CONCERNS

• Significant environmental challenges are well documented at several sites (e.g., the Marble Street Superfund Site)
• Runoff from large industrial sites may contribute pollutant loadings into the Little Calumet River and Grand Calumet River
• See Urban Flooding Risk Assessment (Figure CC-4)
LAND-BASED OPPORTUNITIES (PLANNING PRIORITIES AND CAPITAL PROJECTS)

Previous plans have called for:

- Applying for grant funding through the Illinois Environmental Protection Agency (IEPA) to remediate the Marble Street site and establishing a public-private partnership to redevelop and market the area to industrial end users. (NOTE: RainReady’s recommendation for the Marble Street site differs from this recommendation)

- Continuing Calumet City’s program of sewer and drainage improvements

- Implementing a variety of measures (signs, educational brochures, one-on-one talks with City staff during inspections) to advise property owners of their drainage maintenance responsibilities and ways to mitigate their flooding risk

Here are some ideas that were uncovered through the RainReady planning process:

- The Burnham Greenway Bike Path will be updated to show warning signage and flashers and updated pavement markings. Sidewalk improvements will also be incorporated on the south side of River Oaks Drive from just east of Torrence Avenue to Arthur Avenue.

- The heavy (M2) and light (M1) industrial districts located east of the Burnham Greenway from Michigan City Road to State Street could improve their property edges with green infrastructure (e.g., bioswales, stormwater wetlands, and vegetated filter strip buffers), which would reduce onsite flooding issues and runoff from industrial sites to downstream areas (e.g., Prairie and Marsh Nature Preserve, Burnham Greenway)

- The City should not pursue industrial redevelopment of the Marble Street site
YOUR OPEN SPACE AND NATURAL AREAS

COMMUNITY STRENGTHS

• Ample neighborhood open spaces (e.g., community parks, neighborhood parks, mini-parks), greenways and blueways (e.g., Burnham Greenway, Little Calumet River), and close proximity to forest preserve property and other natural areas (e.g., Sand Ridge Prairie and Nature Center, Superior Street Prairie)

• Calumet Memorial Park Districts’ programs and activities for youth and adults that take place at their parks and facilities

• See Community Asset Map (Figure CC-6)

COMMUNITY CONCERNS

• Parks and natural areas are not well connected to neighborhoods

• Too many unnecessary parking lots

• Cooperative relationship between Holy Cross Cemetery and the Cook County Forest Preserve

• See Urban Flooding Risk Assessment (Figure CC-4)

LAND-BASED OPPORTUNITIES (PLANNING PRIORITIES AND CAPITAL PROJECTS)

Previous plans have called for:

• Developing the Cal-Sag Trail, shared use paths, new on-street bike lanes:
  1. The Cal-Sag Trail
  2. The Michigan City Road Path: this path is important because it provides two way traffic across the City from east to west and vice-versa while also connecting to existing paths in Hammond, Indiana; the Burnham Greenway; and future paths in Dolton. For the most part, there is ample room on either side of the road for a 10’ wide shared use path.
  3. The River Oaks Drive / 159th Street Path: This path is planned to be laid out along the north side of the street. It will connect the multi-family homes in the west to the River Oaks Mall, the proposed campsite in the Shabbona Woods, the Green Lake Family Aquatic Center, and the Burnham Greenway.
  4. Torrence Avenue & Other Forest Preserve Paths: A shared use path along Torrence Avenue is necessary for the already abundant pedestrian use. Fully paved shared use paths will allow bicyclists and pedestrians alike to travel along the routes in a much safer manner. Since the forest preserve is a major recreational location, the development of paths around it will ensure that residents have better access to this amenity.

Calumet City does not own some of these properties or right-of-ways and it is advised that the City work with the Cook County Forest Preserve to ensure that these routes get developed.
5. Ring Road Bike Lane: The existing width of Ring Road is sufficient to accommodate a bike lane on both sides. It will allow residents access to all the retail opportunities around the River Oaks Mall.

6. Burnham Avenue Bike Lane: To create a bike lane on each side of Burnham Avenue the road would need to be widened. It is possible that a shared use path may be able to run along the west side of the road because there is enough room for a 10’ wide path.

7. Wentworth Avenue Bike Lane: Starting at 165th Street and traveling all the way to Garfield Avenue, the existing width of Wentworth Avenue is sufficient to accommodate a bike lane on both sides. However, north of Elizabeth Street there is only room for cars to park on one side of the street to accommodate the new bike lanes. This is a key path as it will eventually lead into the new Town Center. Memorial Drive in between Wentworth Avenue and Freeland Avenue should be widened to accommodate a bike lane and on street parking. This section of the road will be part of the new town center and will give students from the elementary school and users of memorial park a dedicated safe lane to connect to the other trails within the system without limited parking for the school and park.

• Rerouting rooftop stormwater drainage to locations other than storm sewers and harvesting that water for other uses in order to handle stormwater onsite.

• Installing native plant bioswales and raingardens adjacent to and within parking lots, near buildings, within residential yards and parkways to help mitigate flooding issues.

• Installing permeable pavement materials (e.g., permeable concrete, permeable precast pavers, reinforced gravel and grass paving, and permeable asphalt) to allow stormwater to infiltrate through the pavement into the soil below. Some key locations to install permeable pavers include residential driveways, small parking lots, and new sidewalks and crosswalks. The City could provide incentives within its zoning ordinance for those who build permeable driveways and parking lots. These incentives may range from a density bonus to tax incentives.

• Encouraging the use of native grasses, forbs, shrubs, and trees in any landscaping project. Native species can withstand a wide range of temperature extremes, use less water, require less maintenance, and use less fertilizer. The City should amend their current zoning ordinance to include regulations regarding planting native landscaping for certain districts (most likely commercial and industrial districts). Another option would be to draft a set of Design Guidelines which would set out a standard for design of all elements within the community including landscaping.

• Continue to coordinate with the MWRD on the implementation of stormwater projects identified in the Little Calumet River Detailed Watershed Plan (DWP) and other ongoing MWRD-led channel maintenance and capital improving planning and implementation efforts. Improved coordination with the MWRD (and other stakeholders) will help advance projects that protect the City from overbank flooding.

• Creating a new park at the corner of 154th Place and Forsythe Avenue. With the surrounding denser residential uses and close proximity to the hospital, this site is ideal for a community garden.

Here are some ideas that emerged through the RainReady planning process:

• Portions of Calumet City’s oversupply of parking lots could be de-paved and transformed into new open spaces and natural areas (e.g., the outer ring parking along the southern edge of River Oaks Center). These new open spaces could be connected to other parts of town through existing greenways (e.g., the Burnham Greenway).

• The Burnham Greenway could be enhanced with place-making amenities (e.g., public art installations, community gathering spaces) and green infrastructure improvements (e.g., bioswales, tree planning, urban agriculture). These improvements could be applied along the entire greenway or concentrated in the stretch between Pulaski Road and Sibley Boulevard.

• Complete the Burnham Greenway Gap and leverage (via “Trail Town” amenities and development) Calumet City’s unique connection to multiple regional “greenway” (e.g., The Burnham Greenway, The Cal-Sag Trail, The Greenwood Corridor) and “blueways” (e.g., Calumet Water Trails).

• Green infrastructure BMPs (e.g., bioswales, rain gardens, tree plantings) could be installed in parks that are located within or upstream of flood-prone neighborhoods (e.g., Downey Park, Wentworth Woods Forest Preserve, Memorial Park).

• Stream (or “riparian”) restoration efforts along the Little Calumet River and Grand Calumet River could improve its aquatic health, create new outdoor recreation opportunities, beautify neighborhoods, and improve the streams’ capacity to manage large storms.

• Enhancement of Veteran’s Park to include rain gardens and an improved wildlife habitat while making a stronger connection to the Little Calumet. This would include educational elements to highlight the benefits of green infrastructure to this popular park destination.

• Opportunities to connect neighborhoods and residents to the Forest Preserves through improved wayfinding signage, improved gateways, and better street connections with surrounding neighborhoods (e.g., sidewalk improvements).
Existing Conditions in Calumet City, Illinois

COMMUNITY ASSETS

78. Thornton Fractional North High School
COMMUNITY PRIORITIES

Listed below are the community priorities we heard from Calumet City residents, city staff, and elected representatives through the RainReady Planning Process. These community priorities were synthesized with the flooding risk and resilience opportunities assessment to develop Calumet City’s Action Plan.

REORIENT

- Ensure that all municipal planting projects in municipality use native plant species
- Educate residents about the relationship between plants, roots, soil, and hydrology and the benefits of nature plants (e.g., the role that amphibians playing in reducing mosquitos)
- Implement policies that permit the repurposing of vacant commercial and retail buildings as social centers and shared community spaces
- Create more youth after-school activities and expand recreational (fitness and social) programs and employment initiatives for youth
- Implement crime abatement and prevention programs
- Create a list of available funds and key decision-makers to contact
- Work collaboratively with various municipalities and agencies in Northwest Indiana to identify and implement strategies to reduce overland flooding and flooding from the Little Calumet River
- Increase community capacity: planning, community organizing/mobilization, canvassing, implementing on-the-ground projects.

REPAIR (AND MAINTAIN)

- Clean (e.g., remove litter and weeds) and retrofit alleys (e.g., level and regrade gravel, redirect runoff so it flows into end-of-alley bioswales instead of into garages
- Fix broken sidewalks and build new sidewalks where there are none to improve walkability and connections between different parts of Calumet City
- Record data on flood-prone areas

RETROFIT

- Install more rain gardens and tree plantings to beautify neighborhoods and reduce flooding
- De-pave a large portion of River Oaks Center parking lots and create a new natural area and space for outdoor activities (e.g., walking, hiking, birding, launching boats in the Little Calumet River)
- Improve parkways with bioswales and rain gardens that manage street flooding
- Temporarily or permanently clean up (e.g., remove litter) and green vacant lots with low-mow prairie treatments, wildflower treatments, and tree treatment that beautify neighborhoods, improve property values, and reduce flooding
- Improve local ecosystems: find locations to create wildlife habitat and retain flood waters.
- Activate the New Town Center area and create a new police department
- Strategically retrofit vacant lots, alleys, and vast concrete districts with green infrastructure to offset some of the impacts from stormwater, as well as to enhance property values and community aesthetics.
- Increase connectivity to area destinations via on-street bikeways and off-street trails
- Depave expansive parking lots and restore native ecosystems
- Preserve and restore the natural areas along the Little Calumet River and Calumet River
- Create a cistern system on vacant lots in residential areas
The map above overlays flooding risk with proposed “Retrofit” recommendations. The colors correspond to the part of town where the recommendation is to be applied and the numbers correspond with the Retrofit recommendations in the Action Plan. Some recommendations in the Action Plan apply community-wide and are not shown on the map.

This map identifies locations where various green infrastructure projects could be integrated into Calumet City’s community fabric (e.g., green streets along residential streets, commercial complete streets along commercial corridors, green schools, etc.). These locations were identified through a thorough assessment of flooding risk (e.g., known problem areas, survey results, overland flowpaths, depression areas, and impervious coverage) and resilience opportunities (e.g., planning priorities, community assets, capital improvement projects) in Calumet City.

Calumet City should reference this map and the Action Plan to identify opportunities where green infrastructure retrofit projects could be integrated into forthcoming roadway improvements, planned developments, and other capital improvement efforts. This would ensure that future projects deliver multiple benefits, such as improved transportation and flood mitigation.
Steering Committee Mission Statement

A RainReady Calumet City will be a community that works. It will be known a place where residents, city staff, and elected representatives work together and achieve real results. Through strategic and coordinated investments in green, grey, and green-grey infrastructure improvements, Calumet City’s aging infrastructure, crumbling alleys, vacant lots, and expansive parking lots will be transformed from liabilities into community assets. Rainwater that used to flood streets and homes will instead flow into beautiful parkway rain gardens. Underutilized parking lots will be transformed into new places to shop, play, and unwind—perhaps even live! Vacant lots will be turned into beautiful and safe places for youth to play and learn about the natural world in their own backyard. Creative public-private projects, partnerships, and policy changes will drive a virtuous cycle of community investment, environmental restoration, and sustainable development. Calumet City will continue improve and move forward along the path toward greater community resilience. A RainReady Calumet City will survive and thrive no matter what shocks and stresses may arise.

RainReady Goals

- **Reorient** Calumet City so that the community is on a path toward resilience
- **Repair** Calumet City’s municipal sewer and stormwater drainage systems
- **Retrofit** the built landscapes throughout Calumet City with green, grey, and green-grey infrastructure improvements, and restore natural landscapes

NOTE: This plan outlines a path forward toward a more resilient Calumet Corridor, but implementation of specific recommendations will have to occur at the local level. Adopting this plan demonstrates a local community’s commitment to considering these recommendations during capital planning and decision-making efforts and implementing these recommendations as necessary resources become available. In many cases, the City of Calumet City is already actively engaged in a given project or program recommendation. In other cases, additional resources (e.g., external grant funds, dedicated revenue, partnerships, etc.) will be necessary to advance a project or program. The following action plan outlines the actions and associated implementation steps, implementation priority, estimated timeline, and identified potential project leads and resources needed. Further analysis is needed to estimate the costs of most recommendations. The specific details may change as communities take action to advance a recommendation and as new information and opportunities emerge.
**REORIENT**

**COMMUNITY-WIDE STRATEGIES FOR CALUMET CITY**

- **Strategy 1.** Build capacity to make well-informed decisions and execute them
- **Strategy 2.** Plan and implement projects collaboratively
- **Strategy 3.** Promote equitable and resilient development at all levels
- **Strategy 4.** Prepare your community for future shocks and stresses

**REPAIR**

**COMMUNITY-WIDE STRATEGIES FOR CALUMET CITY**

- **Strategy 1.** Map and document your municipal sewer and stormwater drainage system
- **Strategy 2.** Inspect and evaluate your municipal sewer and stormwater drainage system
- **Strategy 3.** Rehabilitate your municipal sewer and stormwater drainage system
- **Strategy 4.** Maintain your municipal sewer and stormwater drainage system

**RETROFIT**

**RETROFIT STRATEGIES FOR YOUR HOMES AND NEIGHBORHOODS**

- **Strategy 1.** Implement a residential resilience program
- **Strategy 2.** Bring new life to vacant residential land
- **Strategy 3.** Create a network of residential green streets, green alleys, and complete streets
- **Strategy 4.** Create green schools and churches

**RETROFIT STRATEGIES FOR YOUR SHOPPING AREAS AND BUSINESS DISTRICTS**

- **Strategy 5.** Bring new life to Calumet City’s New Town Center and commercial corridors
- **Strategy 6.** Bring new life to underutilized parking lots
- **Strategy 7.** Create a network of commercial complete streets

**RETROFIT STRATEGIES FOR YOUR INDUSTRIAL CENTERS AND RAILROAD CORRIDORS**

- **Strategy 8.** Remediate and repurpose the Marble Street site for a shared open space
- **Strategy 9.** Improve the edges of large industrial sites and railroad corridors

**RETROFIT (RESTORE) STRATEGIES FOR YOUR OPEN LAND AND NATURAL AREAS**

- **Strategy 10.** Develop the Cal-Sag Trail and other outdoor recreation amenities
- **Strategy 11.** Integrate green infrastructure into Calumet City’s park system
GOAL 1: REORIENT

COMMUNITY-WIDE RECOMMENDATIONS

STRATEGY 1:
BUILD CAPACITY TO MAKE WELL-INFORMED DECISIONS AND EXECUTE THEM

RECOMMENDATION 1.1
Adopt/Accept the RainReady Calumet City Action Plan; Update the plan every 2-5 years. Incorporate the plan’s recommendations into forthcoming capital improvement planning and decision-making efforts.

Where: Community-wide

How: Participate in the RainReady community planning process (completed); convene a steering committee consisting of residents, municipal staff, and elected representatives (completed); propose and adopt at a Village Board Meeting in early 2017

How much: $104,000 (this cost has already by paid for by Cook County)

Who leads: CNT/RainReady (for initial plan); City of Calumet City (for adoption and plan updates)

Resources needed: Technical Assistance for planning updates

RECOMMENDATION 1.2
Engage in regional and local planning and coordination efforts (e.g., the Calumet Stormwater Collaborative, Millennium Reserve, CMAP’s Comprehensive Regional Plans, SSMMA’s various committees).

Where: Community-wide

How: Read and continually reference stormwater-related resources; align local strategies with regional initiatives to increase access to funding and technical assistance

How much: Varies

Who leads: The City of Calumet City and regional organizations/coalitions like CMAP, SSMMA, CSC, CHP

Resources needed: Internal: the City assigns this task to a staff person; External: the SSMMA could hire a stormwater/resilience-focused staff person to serve this role for all communities in their service area (proposed)

RECOMMENDATION 1.3
Incorporate best practices data management and stormwater planning for local governments (e.g., continual process improvement, performance management, program evaluation, monitoring, ongoing collection and dissemination of useful data, open data and civic hacking).

Where: Community-wide

How: Use a GIS system to collect, manage, and analyze data on water-related complaints and adopted solutions (e.g., type and source of flooding, damage costs, improvements made to property); partner with research institutions to install sensors that will monitor the performance of green infrastructure installations

Priorities and Phasings:

PRIORITY: Medium

PHASING: Ongoing
How much: There will be initial costs to set up these systems, but these improvements could pay for themselves over time through increased operational efficiencies and improved outcomes.

Who leads: City of Calumet City, regional 311 Call Center/Service (proposed-this does not exist yet), SSMMA

Resources needed: Internal: GIS System, staff time; External: SSMMA (data sharing), the Village can expand their monitoring capacity through partnerships with research institutions (e.g., colleges/universities, Argonne National Labs, CNT, UI Labs)

STRATEGY 2:
PLAN AND IMPLEMENT PROJECTS COLLABORATIVELY

RECOMMENDATION 2.1
Sustain the RainReady Calumet Park Steering Committee (SC) and engage this group in the ongoing planning and implementation efforts.

Where: Community-wide

How: Continue to work with the RainReady team in 2017 to get the SC off the ground

How much: Approximately 2-3 hours per month

Who leads: City of Calumet City (e.g., community leaders, municipal staff, elected representatives), CNT/RainReady

Resources needed: CNT/RainReady (to start); ongoing collaboration is volunteer led

RECOMMENDATION 2.2
Incorporate updates on stormwater projects and other resilience-related topics into the Village’s various communication channels.

Where: Community-wide

How: Include a section on “Stormwater Projects” or “Resilience Updates” in official Village communications

How much: Approximately 5-15 hours per month of staff time

Who leads: The City of Calumet City, local media outlets

Resources needed: The City of Calumet City (staff time)

RECOMMENDATION 2.3
Coordinate with neighboring municipalities on stormwater-related planning and development projects, and the sharing of equipment and services via the Illinois Public Works Association. Cross-jurisdictional coordination has been shown to reduce public costs and maximize benefits of projects, increase operational efficiencies, and improve/expand service delivery.

Where: Community-wide and throughout the Calumet region

How: Where appropriate, pursue Intergovernmental Agreements (IGAs) with municipalities and other government agencies (e.g., MWRD, Cook County); the MWRD has an
interest in supporting municipal and regional efforts to share equipment/services related to stormwater management

**How much:** The benefits of cross-jurisdictional coordination (e.g., reduced costs, improved response times) have been shown to outweigh the costs; therefore the investment of staff time in coordination efforts (e.g., approximately 5-10 hours/month) is a good investment

**Who leads:** City of Calumet City, neighboring municipalities, MWRD, CSC, SSMMMA, CMAP

**Resources needed:** Internal: the City of Blue Island, or share costs (i.e., time) of participation with neighboring communities; External: the SSMMMA could hire a stormwater/resilience-focused staff person to serve this function for all communities in their service area (proposed)

**PRIORITY:** Medium

**PHASING:** Ongoing

---

**STRATEGY 3:**
**PROMOTE EQUITABLE AND RESILIENT DEVELOPMENT AT ALL LEVELS—FROM THE HOME TO THE REGION**

**RECOMMENDATION 3.1**
Continue to comply with current stormwater management requirements. Where feasible, improve local ordinances and building codes to promote resilient and equitable development.

**Where:** Community-wide

**How:** Conduct an audit of your local ordinances to evaluate areas for improvement; pass common-sense policy changes/updates; adopt an incremental and adaptive approach to implementing green infrastructure and other resilience-building projects (e.g., the Green Infrastructure Portfolio Standard)

**How much:** N/A

**Who leads:** The City of Calumet City

**Resources needed:** The City of Calumet City (staff time)

**PRIORITY:** High

**PHASING:** Ongoing

---

**STRATEGY 4:**
**PREPARE YOUR COMMUNITY FOR FUTURE SHOCKS AND STRESSES**

**RECOMMENDATION 4.1**
Educate the public on flooding risks.

**Where:** Community-wide

**How:** Continue to train and prepare residents through Calumet City’s Emergency Service & Disaster Agency (ESDA); partner with American Red Cross, FEMA, and other organizations that can provide disaster preparedness training

**How much:** N/A

**Who leads:** The City of Calumet City, ESDA, disaster preparedness organizations/agencies (e.g., American Red Cross, FEMA)

**Resources needed:** Many of these trainings are free and participation is voluntary

**PRIORITY:** High

**PHASING:** Ongoing
RECOMMENDATION 4.2
Continue to utilize an emergency alert system that alerts homeowners, businesses, and visitors know when a flood will likely occur.

**Where:** Community-wide

**How:** Develop real-time flood inundation maps based on data collected from the two nearby stream gages operated by the USGS Illinois Water Science Center (ILWSC); distribute information on the extent of various flood events to local emergency managers and residents so they can take appropriate actions to minimize damage.

**How much:** TBD

**Who leads:** The City of Calumet City, ESDA, USACE, USGS

**Resources needed:** Grant funding targeted to creating an emergency alert system

**PRIORITY:**

**PHASING:**

---

RECOMMENDATION 4.3
Ensure that at least one City staff person (or a consultant who does work on behalf of the City) has one or more the following certifications: Certified Floodplain Manager (CFM), National Green Infrastructure Certification Program (NGICP), LEED-ND.

**Where:** Community-wide

**How:** Incentivize the appropriate staff person (e.g., reimburse the costs) to earn and maintain certifications or require that Village contractors and consultants involved with land development have these certifications.

**PRIORITY:**

**PHASING:**

---
COMMUNITY-WIDE RECOMMENDATIONS

**STRATEGY 1:**
MAP AND DOCUMENT YOUR MUNICIPAL SEWER AND STORMWATER DRAINAGE SYSTEM

**RECOMMENDATION 1.1**
Ensure that Calumet City has up-to-date sewer atlas information and a system for documenting information on the conditions of the overall system, specific elements (e.g., catch basins, curbs), and flooding problem areas.

*Where:* Community-wide

*How:* Continue to update this information and share it through SSMMA's GIS consortium (and other regional data-sharing portals) to facilitate more streamlined inter-jurisdictional stormwater planning efforts

*Who leads:* The City Engineer, Public Works, SSMMA

*Resources needed:* Internal: the General Fund, Water Fund

**PRIORITY:**

</tr>
</tbody>
</table>

**STRATEGY 2:**
INSPECT AND EVALUATE YOUR MUNICIPAL SEWER AND STORMWATER DRAINAGE SYSTEM

**RECOMMENDATION 2.1**
Develop and implement a comprehensive inspection program (e.g., visual inspection, closed circuit television inspection) to regularly assess the condition of Calumet City’s municipal sewer system (e.g., manholes, catch basins, sewers)

*Where:* Community-wide (inspect known problem areas first)

*How:* Establish a feasible, continuous, and cyclical inspection schedule (e.g., televise 10% of the sewers for 10 years, then repeat); Use Calumet City’s Urban Flooding Risk Assessment (see Figure CC-4) to identify and prioritize known flooding problem areas

*Who leads:* The City Engineer, Public Works

*Resources needed:* Internal: the General Fund, Water Fund, TIF Funds (where appropriate), External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219

**STRATEGY 3:**
REHABILITATE YOUR MUNICIPAL SEWER AND STORMWATER DRAINAGE SYSTEM

**RECOMMENDATION 3.1**
Repair major sewer defects, such as collapsed sewers, identified through the inspection program (see Recommendation 2.1).

*Where:* Targeted repairs in known problem areas

*How:* Complete +/- 5 repairs per year; Use Calumet City’s Urban Flooding Risk Assessment (see Figure CC-4) to identify and prioritize known flooding problem areas

*Who leads:* The City Engineer, Public Works

*Resources needed:* Internal: the General Fund

*CALUMET CITY - 28*
**Who leads:** The City Engineer, Public Works

**Resources needed:** Internal: the General Fund, Water Fund, TIF Funds; External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219

**PRIORITY:**

**PHASING:**

---

**RECOMMENDATION 3.2**
Line deteriorated sanitary sewer mains observed by the inspection program (see Recommendation 2.1)

**Where:** Community-wide (inspect known problem areas first)

**How:** Line sewers in known problem areas; aim to line 3% of the sewers per year; use Calumet City’s Urban Flooding Risk Assessment (see Figure CC-4) to identify and prioritize known flooding problem areas

**How much:** TBD

**Who leads:** The City Engineer, Public Works

---

**RECOMMENDATION 4.2**
Implement the comprehensive Green/Grey Infrastructure Maintenance plan program in tandem with inspection program (see Recommendation 2.1). The entire sewer system should be cleaned on a ten-year cycle to ensure optimal function

**Where:** Community-wide (inspect known flooding problem areas first)

**How:** Televise and clean 10% of Calumet City’s sewers every year; use Calumet City’s Urban Flooding Risk Assessment (see Figure CC-4) to identify and prioritize known flooding problem areas

**How much:** TBD

**Who leads:** The City Engineer, Public Works

---

**STRATEGY 4:**
**MAINTAIN YOUR MUNICIPAL SEWER AND STORMWATER DRAINAGE SYSTEM**

**RECOMMENDATION 4.1**
Develop and follow a comprehensive maintenance plan describing how all green, grey, and green-grey infrastructure systems will be maintained

**Where:** Community-wide

**How:** Apply for planning and technical assistance grants to develop this maintenance plan

**How much:** $~15,000 to $20,000

**Who leads:** The City Engineer, Public Works

**Resources needed:** Internal: the General Fund, Water Fund, TIF Funds (where appropriate), External: CMAP’s LTA program, HUD CDBG, IDNR Coastal Management Program Grants

**PRIORITY:**

**PHASING:**

---

**PRIORITY:**

**PHASING:**
RECOMMENDATIONS FOR YOUR HOMES AND NEIGHBORHOODS

STRATEGY 1:
IMPLEMENT A RESIDENTIAL RESILIENCE PROGRAM

RECOMMENDATION 1.1
Establish a residential cost-sharing program to help homeowners recover from past storms and prepare for future storms. Under this program, residents would receive financial support for a complete home inspection and improvements targeted to reduce risk, like check valves, overhead sewers, and a rain garden.

Where: Community-wide

How: Partner with the delegate agencies/organizations tasked with implementing such programs in your region; renew and expand (if feasible) the City’s 50/50 residential cost-share program; target program outreach and recruitment efforts to the most flood-prone areas in Calumet City

How much: Varies

Who leads: The City of Calumet City, Cook County, RainReady

Resources needed: Internal: General Fund, municipal cost-share program; External: Cook County’s Residential Resilience Program (CDBG-DR), DOE Weatherization and Intergovernmental Program Office grants, other home assistance grants offered through regional agencies

PRIORITY: High

PHASING: Short

STRATEGY 2:
BRING NEW LIFE TO VACANT RESIDENTIAL LAND

RECOMMENDATION 2.1
Bring new life to vacant residential land with native plants, tree planting, urban agriculture, and other strategies that beautify neighborhoods and reduce flooding.

Where: Community-wide, concentrate efforts in the neighborhoods south of Pulaski Road between Burnham Avenue and State Line Road where there is a large concentration of vacant parcels; multiple: Southwest corner of 154th Street and Forsythe Avenue; 12 block area (south of 154th Street, east of Lincoln Avenue, north of 156th Street, and west of State Line)

How: Create programs that incentivize residents and community groups to improve nearby vacant properties (via temporary
use rights or permanent land ownership); such programs could be: Adopt-A-Lot, Side Yard/Large Lot programs, land banking, temporary transfer of use rights to a community group, community greening, and award programs.

How much: The City of Chicago’s “Large Lot Program” enables adjacent property owners, block clubs, and non-profit groups in select neighborhoods to purchase city-owned land for $1 per parcel.

Who leads: City of Calumet City, SSLBA, current homeowners, community organizations.

Resources needed: The City of Calumet City would effectively absorb the costs in terms of lost future property tax revenue on these particular parcels. However, the benefits of neighborhood stabilization, reduced crime, and spillover effects (e.g., increased property values due to greening vacant lots) would likely offset these costs. Residents and community groups could attain property at a very affordable price (e.g., $1).

RECOMMENDATION 2.2

Connect Calumet City’s newly activated vacant lots (see Recommendation 2.1) to the City’s expanding network of green alleys (see Recommendation 3.2).

Where: Community-wide (focus pilot project efforts on blocks with: 1) frequently- flooded alleys, 2) city-owned vacant properties, a 3) neighbors and/or community groups with an interest in managing/owning a parcel(s))

How: Redirect stormwater runoff from alleys (through regrading) into vacant lots that have been improved with green stormwater infrastructure (e.g., rain gardens, naturalized detention basins, and tree planting).

How much: TBD

Who leads: The City Engineer.

Resources needed: Internal the General Fund, Water Fund, TIF Funds (where appropriate), External:CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219.

PRIORITY: 

PHASING: 

STRATEGY 3:
CREATE A NETWORK OF RESIDENTIAL GREEN STREETS, GREEN ALLEYS, AND COMPLETE STREETS

RECOMMENDATION 3.1

Create a network of residential green streets that incorporate green infrastructure improvements (e.g., roadside swales, rain gardens, permeable pavement, tree plantings) along flood-prone residential streets. Ensure that any community greening projects on public or private land fit the community’s preferences for neighborhood aesthetics (e.g., size, color, and “look and feel” of installations), while also providing flood-reduction and other benefits.

Where: Multiple: Green Streets: all streets within the “Frogtown
Area” – i.e., the area between Wilson Avenue, Paxton Avenue, Pulaski Road, and Exchange Avenue; Mackinaw Avenue from Sibley Boulevard to Pulaski Road; Price Avenue from Wilson Avenue to 156th Place; Freeland Avenue from Sibley Boulevard to Warren Street; Lincoln Avenue from Sibley to Webber Street; Stewart Avenue from I-94 to Torrence Avenue; Burnham Greenway to the eastern municipal border; Pulaski Road from Burnham Greenway to the eastern municipal border

How: Use this RainReady Plan identify potential locations where green streets can be piloted; where appropriate, incorporate green infrastructure BMPs into planned roadway improvements; monitor the performance of select green infrastructure installations; adjust the future implementation of green infrastructure projects based on monitoring data and community feedback.

How much: N/A

Who leads: The City of Calumet City; organizations specializing in the installation and maintenance of neighborhood green infrastructure

Resources needed: Internal: the General Fund, the Water Fund, TIF funds (where appropriate); External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219; STP funds

PRIORITY: High

PHASING: Medium

RECOMMENDATION 3.2

Install green alleys that reduce wear-and-tear on cars (via re-grading and filling potholes) and manage stormwater runoff with permeable pavement, end-of-alley stormwater bulbouts, and redirecting runoff into vacant lots (see Recommendation 2.2).

Where: Multiple: alleys between 156th Street and 156th Place from Forsythe to State Line; 155th Place and 156th Street from Wentworth to State Line; 157th Street and Webb Street from Lincoln Avenue to Wentworth

How: Over the years, layers of gravel (used for alley paving) have accumulated in certain alleys; this accumulated gravel has raised the crown of the alleys and causes runoff to flow into residents’ garages or pool in potholes; there are two potential solutions to this problem 1) regrade the alleys so that stormwater runoff flows toward end-of-alley stormwater bulbouts or vacant lots that are intended to hold water, or 2) install permeable alleys with a gravel gallery

How much: TBD

Who leads: The City of Calumet City, Public Works

Resources needed: Internal: the General Fund, External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219

PRIORITY: Medium

PHASING: Medium
Creating more connected neighborhoods is a key local planning priority. Calumet City has already demonstrated support for Complete Streets and the City Board is expected to adopt an official Complete Streets policy early in 2017. Complete streets have been shown to be an effective strategy for improving neighborhood connectivity, creating safer streets, and managing stormwater. Therefore, Calumet City should continue its exemplary Complete Streets leadership and create a network of residential complete streets that integrate green infrastructure improvements (see Recommendation 3.1), bike and pedestrian improvements, traffic-calming road features, and other place-making amenities (e.g., benches, people spots) into forthcoming transportation improvement projects.

Where: Refer to the City’s Active Transportation Plan; use this plan to identify (at a planning level) where green infrastructure BMPs can be incorporated into planned transportation improvements.

How: Where appropriate, incorporate green infrastructure BMPs into planned complete street roadway improvements; monitor the performance of select green infrastructure installations; adjust the future implementation of green infrastructure projects based on monitoring data and community feedback.

NOTE: Given the additional traffic engineering involved, creating complete streets is more intensive than green streets.

How much: TBD

Who leads: The City of Calumet City, Active Transportation Alliance (for initial plan)

Resources needed: Internal: the General Fund, the Water Fund, TIF funds (where appropriate); External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219; STP funds

STRATEGY 4: CREATE GREEN SCHOOLS AND CHURCHES

RECOMMENDATION 4.1
Create green schoolyards that: 1) manage stormwater with green infrastructure (e.g., rain gardens, permeable pavement, urban agriculture, rain barrels, and cisterns); 2) produce healthy foods; and 3) create spaces for more active play, physical education, and outdoor learning.

Where: Multiple: Lincoln Elementary School (410 157th Street), Thornton Fractional North High School (755 Pulaski Road), Woodrow Wilson Elementary School (560 Wentworth Avenue), Hoover Elementary School and Schrum Memorial School (1255 Superior Avenue)

How: Reach out to local school district and the administration to determine interest in such a program; if there is interest, establish a partnership in the spirit of Space to Grow in Chicago in which the capital and maintenance costs are shared between public and private partners.

How much: TBD
**Who leads:** The City of Calumet City, local school districts, schools (e.g., administrations, faculty, students, families), the MWRD, Cook County, local environmental organizations

**Resources needed:** Internal: School district funds, General Fund; External: MWRD capital improvement funds, Cook County CDBG-DR funds; Calumet City could develop a public-public private partnership in which funds from multiple sources are leveraged and costs are shared

**PRIORITY: TBD LOCALLY**

**PHASING:**

---

**RECOMMENDATION 4.2**

Create green churches that manage stormwater with green roofs, depaving impervious surfaces (where feasible), rain gardens, parking lot bioswales, permeable pavement, and cisterns to capture water from roofs. In other communities church grounds and facility mangers are incorporating these green improvements into the church’s mission (e.g., prayer trails, outdoor space for congregation gatherings)

**Where:** Multiple: Our Lady of Knock (501 163rd Street); St. Andrew the Apostle Church - Catholic Parish (768 Lincoln Avenue)

**How:** Educate church leaders, congregations, parishioners, etc. on the benefits of green infrastructure; streamline the permitting process for churches seeking to make green infrastructure improvements to their property; connect churches to the organizations/agencies that can provide financial and technical assistance

**How much:** TBD

**Who leads:** Individual churches and their congregations/parishioners

---

**Resources needed:** Internal: church capital funds and endowments; External: IDNR Coastal Management Grants, Chi-Cal Rivers Fund grants, other private foundation grants

**PRIORITY: TBD LOCALLY**

**PHASING:**

---

**RECOMMENDATIONS FOR YOUR SHOPPING AREAS AND BUSINESS DISTRICTS**

---

**STRATEGY 5:**

**BRING NEW LIFE TO CALUMET CITY’S NEW TOWN CENTER AND COMMERCIAL CORRIDORS**

**RECOMMENDATION 5.1**

Continue to invest in and bring new life to the Calumet City’s Town Center. Open a new police station near City Hall to deter crime in the area. Improve the nearby vacant residential properties (see Recommendation 2.1), improve Memorial Park (see Recommendation 11.1) and create a community garden, connect the district to other parts of town through commercial and residential complete streets and trails, and mitigate local flooding issues by incorporating green infrastructure BMPs (e.g., planter boxes, tree plantings, cisterns, roadside bioswales, parking lot bioswales, native plant rain gardens, and permeable pavement) into these projects wherever it is possible.

**Where:** Calumet City’s Town Center district

**How:** Convene a planning team to oversee any plan development and project implementation activities (or incorporate this task into the work plan of an existing government unit); explore public-private strategies for funding and implementing capital improvement projects; coordinate transportation and stormwater infrastructure investments when
planning and implementing projects, for example, incorporate green infrastructure BMPs and bikeway improvements when you are re-surfacing/improving a road.

**How much:** TBD

**Who leads:** City of Calumet City, the Planning Team Calumet Memorial Park District, Chamber of Commerce

**Resources needed:** Infrastructure improvements are paid through various funding internal and external sources; other place-making amenities (e.g., wayfinding signage, street decorations, benches, etc.) can be stacked on infrastructure improvements and paid for with private funds (via donations) or public-private partnerships.

**PRIORITY:**

**PHASING:**

**RECOMMENDATION 5.2**

Connect (via off-road trails, bikeways, and new sidewalks) a newly-revitalized Town Center to the Marble Street site which has been cleaned up and preserved as an open space and outdoor recreation amenity. Nearby communities (e.g., Palos Heights, Orland Park, Michigan City) are reaping the economic, social, and environmental benefits of new trails and connected green spaces and Calumet City can too.

**Where:** New Town Center district with greenway connections to the Marble Street site

**How:** This long-term strategy builds on multiple shorter term strategies (e.g., activating the New Town Center district, transforming the Marble Street superfund site into an open space amenity, creating a network of complete streets); with connections to multiple regional greenways and blueways, Calumet City is well-positioned to leverage these natural assets to promote eco-tourism and new retail, and attract young families and professionals interested in a community with such amenities.

**How much:** TBD

**Who leads:** City of Calumet City, EPA, SMMA, NPS, ATA

**Resources needed:** Internal: the General Fund, TIF funds, External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219, IDNR Coastal Management Grants

**PRIORITY:** TBD LOCALLY

**PHASING:**

**RECOMMENDATION 5.3**

Increase retail activity, improve the pedestrian environment, and create a “sense of place” within Calumet City’s commercial corridors by: 1) pursuing creative, mixed-use redevelopment projects; 2) implementing a façade improvement program, form-based codes, or other design guidelines that ensure that new developments fit the community’s desired character; and requiring the use green infrastructure BMPs (e.g., permeable pavement, de-paving, bioswales, naturalized detention basins with place-making amenities, tree planting, etc.) to manage stormwater from the sites.

**Where:** Sibley Boulevard Corridor*, Torrence Avenue
Corridor*, Pulaski Road Corridor, River Oaks Corridor, Wentworth Woods Corridor*

*Corridors where GI improvements would have the most flood reduction benefits for downstream neighborhoods

How: The City of Calumet City has several tools with which to encourage and incentivize smart and resilient infill redevelopment (e.g., removing minimum parking requirements, changing zoning, converting parking lots into open space and new mixed-use developments, investing in pedestrian-oriented infrastructure)

How much: N/A

Who leads: The City of Calumet City, local businesses, Chamber of Commerce

Resources needed: Internal: the General Fund, TIF funds, External: CDBG, DCEO, IEPA State Revolving Loan Fund, USACE Section 219

PRIORITY: High

PHASING: Medium

STRATEGY 6:
BRING NEW LIFE TO UNDERUTILIZED PARKING LOTS

RECOMMENDATION 6.1
Calumet City has many underutilized parking lots. These large impervious parking lots are one of the largest generators of polluted stormwater runoff. Conversely, they also present an opportunity for smart infill redevelopment, revitalizing commercial corridors (see Recommendation 7.1), open space creation, and ecological restoration.

Where: Multiple: linear cluster of parking lots along Sibley Boulevard from I-94 to Torrence Avenue (there is very large depression at Pete’s Fresh Market); Bernadine Manor (1700 Memorial Drive); linear cluster along Torrence Avenue from Sibley Boulevard to Pulaski Road

How: Calumet City should bring new life to its underutilized parking lots by: 1) retrofitting parking lots with green infrastructure BMPs (e.g., permeable pavement, rain gardens, bioswales), 2) implementing infill redevelopment where appropriate (see Recommendation 7.1), 3) de-paving parking lots and converting them into open space (see Recommendation 8.2), and 4) removing minimum parking requirements and making other policy changes that insure that new developments do not construct excessive parking

How much: N/A
Who leads: City of Calumet City, local businesses, parking lot owners

Resources needed: City of Calumet City, parking lot owners

PRIORITY: TBD LOCALLY

PHASING: Ongoing

RECOMMENDATION 6.2
River Oaks Mall (or “River Oaks Center”) is key economic driver and defining feature in Calumet City. Improving this regional asset will be a key component of Calumet City’s resilient revitalization. Given the mall’s proximity to the Little Calumet River, a renewed interest in riverfront development and amenities, and the potential for flood reduction, green amenities should be considered when planning and designing improvements to the River Oaks Center and surrounding areas. These green amenities could include such things as new river walk, new green spaces that manage stormwater, trail connections to the Burnham Greenway, and other green infrastructure BMPs that could be incorporated into redevelopment efforts.

Where: River Oaks Mall

How: Convene a planning team that will oversee any plan development and project implementation activities (or incorporate this task into the work plan of an existing government unit); explore public-private strategies for funding and implementing capital improvement projects of this scale; secure necessary technical assistance and funding resources; engage residents in planning and implementation efforts; construct this project; market this nationally-significant, and highly innovative community amenity to attract new businesses and visitors alike

How much: TBD

Who leads: City of Calumet City, local businesses, parking lot owners

Resources needed: TBD

PRIORITY: TBD LOCALLY

PHASING: Long

STRATEGY 7:
CREATE A NETWORK OF COMMERCIAL COMPLETE STREETS

RECOMMENDATION 7.1
In 2016, the Village of Calumet Park adopted a complete streets ordinance (Ordinance 16-1145). Local leaders anticipate that the City Board will adopt an official Complete Streets Policy in early 2017. The City should continue to strengthen its
position as a regional leader in complete streets by creating a network of commercial complete streets that: facilitate the safe transportation for all modes of transportation (e.g., walking, biking, transit, driving); revitalize commercials corridors with traffic-calming and place-making features; and reduce urban flooding with green infrastructure BMPs (e.g., bioswales, permeable pavement, planter boxes, tree planting).

**Where:** See the Village’s Active Transportation plan; use this plan to identify (at a planning level) where green infrastructure BMPs can be incorporated into planned transportation improvements

**How:** Where appropriate, incorporate green infrastructure BMPs into planned complete street roadway improvements; monitor the performance of select green infrastructure installations; adjust the future implementation of green infrastructure projects based on monitoring data and community feedback

**How much:** TBD

**Who leads:** The City of Calumet, IDOT, ATA, CMAP

**Resources needed:** Internal: the MFT, General Fund, TIF Funds (where appropriate), External: CDBG, special grants from DCEO, IDOT, STP

**PRIORITY: TBD LOCALLY**

**PHASING:**

**STRATEGY 8:**

**RECOMMENDATION 8.1**

Calumet City’s Comprehensive Plan calls for remediating and marketing the Marble Street site—a 35-acre Superfund Site in the northeast corner of the City—to potential industrial end users. This recommendation was informed by the 2009 Marble Street Development Plan. Given the site’s secluded location and proximity to industrial areas in Hammond, pursuing an industrial land use is a valid land use decision. However, preserving this site for industrial uses would preclude the City from pursuing other development options, which may produce more long-term value for the City. Considering: 1) the types of amenities (e.g., parks, trails, local destinations) that young professionals and families are looking for; 2) Calumet City’s excellent access to regional greenways and blueways; and 3) the availability of funding opportunities for land and water restoration work, we recommend that Calumet City remediate and repurpose the Marble Street site for a shared open space, which could be connected to the City’s Town Center and regional greenways and blueways.
**Where:** The Marble Street Property

**How:** Explore whether or not members of the Cal-Sag Trail Coalition would be willing to provide technical greenways and trails planning assistance; convene a planning team to oversee the development and implementation of an open space plan for the site; apply for technical assistance and grant funds to complete this plan; engage residents in the planning process; complete all necessary project enabling tasks; explore public-private partnerships and strategies for funding and implementing the plan; seek to connect this “Marble Street Recreation Area” to local amenities in Calumet City (e.g., Town Center) as well as regional blueways and greenways.

**How much:** TBD

**Who leads:** The City of Calumet City, the Cal-Sag Trail Coalition; the planning team; technical assistance providers

**Resources needed:** Internal: General Fund, TIFs; External: US EPA (Great Lakes Restoration Initiative Funds), Growth Zone

**STRATEGY 9: IMPROVE THE EDGES OF LARGE INDUSTRIAL SITES AND RAILROAD CORRIDORS**

**RECOMMENDATION 9.1**

Improve the edges of large industrial sites and railroad corridors by improving ditches (e.g., increase storage/conveyance capacity, remove invasive plants like phragmites), installing bioswales along railroad tracks, and constructing mixed-use trails where it is appropriate and feasible.

**Where:** The industrial areas along the Burnham Greenway and in the Northeast corner of the City (along State Street)

**How:** Establish a partnership with industrial site owners; explore their willingness to make improvements to their land; use Growth Zone incentives to implement stormwater improvements at industrial centers and railroad corridor; connect industrial edge improvements to regional greenways when possible

**How much:** TBD

**Who leads:** City of Calumet City, owners of local industrial businesses, railroad companies

**Resources needed:** TBD

**PHASING:**

**PRIORITY:** TBD

**PHASING:**
STRATEGY 10: DEVELOP THE CAL-SAG TRAIL AND OTHER OUTDOOR RECREATION AMENITIES

RECOMMENDATION 10.1
If Calumet City’s various multi-use trail projects are implemented, Calumet City will have access to hundreds of miles of land and water trails. Calumet City’s location within the Calumet Region and access to several regional greenways and blueways is a competitive advantage that—if leveraged—could drive increased retail activity and other quality-of-life improvements. Therefore, Calumet City should develop the Cal-Sag Trail other regional greenway and blueway projects. The final design of these projects should aim to: 1) connect people to places (e.g., parks, schools, restaurants, venues); mitigate flooding through green infrastructure BMPs (e.g., roadside bioswales, permeable pavement, tree planting); and create beautiful places to walk, rest, and gather through place-making amenities (e.g., rest areas and gathering places, signage to help walkers find their way, historical and educational signage) into benches, public art, gathering spaces).

Where: The proposed Cal-Sag Trail and Burnham Greenway Gap Trails

How: Engage residents in the trail planning and design process; ensure that GI BMPs are included in the final trail designs; seek to create connections to points-of-interest (e.g., Downtown Dolton, Lake Cottage Grove, Needles Park) via Calumet City’s expanding network of commercial and residential complete streets; leverage the new trail to support Dolton’s economic development (e.g., use Dolton’s “trail town” status to drive increased retail activity and housing goals (e.g., market Dolton to families and young professionals seeking an affordable community with great access to parks open space)

How much:

Who leads: City of Calumet City, the Cal-Sag Trail Coalition

Resources needed: Funding to complete Calumet City’s segment of the Trail

PRIORITY: High

PHASING: Long

STRATEGY 11: INTEGRATE GREEN INFRASTRUCTURE INTO CALUMET CITY’S PARK SYSTEM

RECOMMENDATION 11.1
Calumet City is fortunate to have a strong network of parks scattered throughout town. Many of these parks are located in flood-prone neighborhoods, and the installation of green infrastructure BMPs at these parks could help alleviate local flooding issues (by keeping water out of the local sewers). The Calumet Memorial Park District should consider ways to incorporate green infrastructure practices into the ongoing maintenance and capital improvement efforts.
**Where:** Multiple: Calumet Park (421 Warren Street), Memorial Park (612 Wentworth Avenue), Burnham Greenway (between State Street and Pulaski Road), Downey Park (300 Jeffery Avenue)

**How:** Include green infrastructure project(s) in the Calumet City’s Park District’s ongoing capital improvement planning and implementation efforts; implement a policy that encourages the conversion of underutilized lawns into native plant gardens; apply for grants as opportunities arise

**How much:** TBD

**Who leads:** The Calumet City Memorial Park District

**Resources needed:** Funding to improve existing and new park spaces

**PRIORITY:** Medium

**PHASING:** Ongoing
